WIKKA Introduces a New Generation of Pressure Transmitter with Integral LED Display and Programmable Solid State Switches

WIKKA Instrument Corporation (WIKKA) is pleased to announce the PSD-30 with integral LED display and programmable solid state switches is now available. The PSD-30 is designed for use as an intelligent “multi-function” pressure transmitter for many industrial control applications.

The design and outstanding functionality of the PSD-30 received the IF Product Design Award in 2009. The display, with its .35“ (9 mm) high digits, is designed to be as large as possible and positioned at an angle, so the pressure reading is visible from a distance of at least 10 feet (3 meters). Time-proven and rugged LED technology with 14-segment display is used so alphanumeric messages are much easier to understand compared to typical 7-segment displays.

The PSD-30 is designed for pumps and compressors, machine tools, machine building, hydraulics and pneumatics, and many other industrial applications.

The WIKKA PSD-30 special features include:

- Available with single or dual NPN or PNP solid state switches
- High visibility, rugged 14-segment red LED display
- Electronically rotates 180° for top-down installation
- Independent rotation between the M12x1 electrical connection and the display
- User-friendly, intuitive 3-key operation
- Versions with 4-20 mA or 0-10V analog output
- Programming menu meets VDMA standards for user friendly navigation
