Electronic differential pressure switch with display
Model A2G-45

Applications
- Electronic differential pressure switch for monitoring the differential pressure of air and other non-inflammable and non-aggressive gases
- Monitoring of air filters, blowers in ventilation ducts
- Control of air and fire shutters and for overpressure monitoring in clean rooms and laboratories

Special Features
- Simple mounting
- Compact and robust design
- LCD display
- Simple setting of the switch point (relay output)
- Output signal 0 ... 10 V

Standard Features

Design
Per 89/336/EEC electromagnetic compatibility and RoHS directive 2002/95/EC

Accuracy class
1.5 % of full span

Measuring ranges
- Option 1: -2 ... +2 InWC (factory set)
  (-0.4 ... +0.4 InWC, -1 ... +1 InWC, -1.2 ... +1.2 InWC selectable via jumpers)
- Option 2: 0 ... 10 InWC (factory set)
  (0 ... 0.4 InWC, 0 ... 1 InWC, 0 ... 4 InWC selectable via jumpers)

Maximum pressure
100 InWC

Permissible temperature
Ambient: -4 ... +158 °F
Media: +14 ... +122 °F
(+23 ... +122 °F with automatic zero adjustment)

Ingress protection
IP 54 per EN 60529 / IEC 529 (NEMA 3)

Weight
5.2 oz.
If the voltages being switched via the relays are not in accordance with SELV, then the power supply and signal/control cables of the relays should be installed so that they are separated. A separate cable entry is available for both.
Buttons for setting the individual functions

Menu selection and initialisation instructions for installation

1. Pressure units selectable: Pa, kPa, mmH₂O, inchWC, mbar
2. Measuring ranges selectable, see page 1
3. Response time selectable: 0.5 ... 10 s
4. Zero point adjustment and span calibration
5. Set point (between min. and max. pressure)
6. Hysteresis (0 ... 5 % of measuring range)
Zero point adjustment

Attention!
Connect the voltage supply one hour before making the zero point adjustment.

- Remove both hoses from the pressure connections ⊕ and ⊖.
- Press both the "up" and "down" buttons simultaneously, or select "Zero" in the setting menu: ⇒ the green LED switches off and "Zero" is shown in the display.
- Wait until the green LED switches back on, then reconnect the ⊕ and ⊖ pressure connections.

4. In normal operation, we recommend that a zero point adjustment is carried out every 12 months.

Span calibration

Attention!
Connect the voltage supply one hour before making the span calibration.

A reference pressure measuring instrument is needed for the span setting.

The span should not be set without pressure being present. If the span is set with either no test pressure, or too low of a pressure, the instrument will lose its accuracy and no longer provides correctly measured values.

If this should occur, select the menu point "Span" and then select "Reset", in order to reset the span setting.

Set the span in the following sequence:

1. Carry out a zero point calibration
2. Connect the pressure connections
3. Select "Span" in the menu and then select "Adjust"
4. Using both the "up" and "down" arrow buttons, set the relevant value for the display or the 0 … 10 V output, so that it matches the reference pressure instrument's value
5. Confirm the setting by pressing the "OK" button
