## Safety instructions for Ex areas

Take note of the Ex specific safety instructions for Ex applications. These instructions are attached as documents to each instrument with Ex approval and are part of the operating instructions manual.

Editing status: 2018-03-05
1 About this document

1.1 Function
This operating instructions manual provides all the information you need for mounting, connection and setup as well as important instructions for maintenance, fault rectification, the exchange of parts and the safety of the user. Please read this information before putting the instrument into operation and keep this manual accessible in the immediate vicinity of the device.

1.2 Target group
This operating instructions manual is directed to trained personnel. The contents of this manual must be made available to the qualified personnel and implemented.

1.3 Symbols used
- **Information, tip, note**
  This symbol indicates helpful additional information.
- **Caution**: If this warning is ignored, faults or malfunctions can result.
- **Warning**: If this warning is ignored, injury to persons and/or serious damage to the instrument can result.
- **Danger**: If this warning is ignored, serious injury to persons and/or destruction of the instrument can result.
- **Ex applications**
  This symbol indicates special instructions for Ex applications.
- **List**
  The dot set in front indicates a list with no implied sequence.
- **Action**
  This arrow indicates a single action.
- **Sequence of actions**
  Numbers set in front indicate successive steps in a procedure.
- **Battery disposal**
  This symbol indicates special information about the disposal of batteries and accumulators.
2 For your safety

2.1 Authorised personnel
All operations described in this documentation must be carried out only by trained specialist personnel authorised by the plant operator. During work on and with the device the required personal protective equipment must always be worn.

2.2 Appropriate use
The CPT-2x is a pressure transmitter for process pressure and hydrostatic level measurement.

You can find detailed information about the area of application in chapter “Product description”.

Operational reliability is ensured only if the instrument is properly used according to the specifications in the operating instructions manual as well as possible supplementary instructions.

2.3 Warning about incorrect use
Inappropriate or incorrect use of this product can give rise to application-specific hazards, e.g. vessel overfill through incorrect mounting or adjustment. Damage to property and persons or environmental contamination can result. Also, the protective characteristics of the instrument can be impaired.

2.4 General safety instructions
This is a state-of-the-art instrument complying with all prevailing regulations and directives. The instrument must only be operated in a technically flawless and reliable condition. The operator is responsible for the trouble-free operation of the instrument. When measuring aggressive or corrosive media that can cause a dangerous situation if the instrument malfunctions, the operator has to implement suitable measures to make sure the instrument is functioning properly.

During the entire duration of use, the user is obliged to determine the compliance of the necessary occupational safety measures with the current valid rules and regulations and also take note of new regulations.

The safety instructions in this operating instructions manual, the national installation standards as well as the valid safety regulations and accident prevention rules must be observed by the user.

For safety and warranty reasons, any invasive work on the device beyond that described in the operating instructions manual may be carried out only by personnel authorised by the manufacturer. Arbitrary conversions or modifications are explicitly forbidden. For safety reasons, only the accessory specified by the manufacturer must be used.

To avoid any danger, the safety approval markings and safety tips on the device must also be observed and their meaning read in this operating instructions manual.
2.5 EU conformity
The device fulfils the legal requirements of the applicable EU directives. By affixing the CE marking, we confirm the conformity of the instrument with these directives.

2.6 SIL qualification according to IEC 61508
The Safety Integrity Level (SIL) of an electronic system is used to assess the reliability of integrated safety functions.

For detailed specification of the safety requirements, multiple SIL levels are specified according to safety standard IEC 61508. You can find detailed information in chapter "Functional safety (SIL)" of the operating instructions.

The instrument meets the specifications of IEC 61508: 2010 (Edition 2). It is qualified for single-channel operation up to SIL2. The instrument can be used homogeneously redundant up to SIL3 in multi-channel architecture with HFT 1.

2.7 Permissible process pressure
For safety reasons, the instrument must only be operated within the permissible process conditions. You can find detailed information on the process conditions in chapter "Technical data" as well as on the type label.

The permissible process pressure range is specified on the type label with "Process pressure", see chapter "Configuration". This applies even if a measuring cell with a measuring range (order-related) higher than the permissible pressure range of the process fitting is installed.

A temperature derating, e.g. with flanges, can limit the permissible process pressure range.

2.8 NAMUR recommendations
NAMUR is the automation technology user association in the process industry in Germany. The published NAMUR recommendations are accepted as the standard in field instrumentation.

The device fulfils the requirements of the following NAMUR recommendations:
- NE 21 – Electromagnetic compatibility of equipment
- NE 43 – Signal level for fault information from measuring transducers
- NE 53 – Compatibility of field devices and display/adjustment components
- NE 107 - Self-monitoring and diagnosis of field devices

For further information see www.namur.de.

2.9 Installation and operation in the USA and Canada
This information is only valid for USA and Canada. Hence the following text is only available in the English language.
Installations in the US shall comply with the relevant requirements of the National Electrical Code (ANSI/NFPA 70).
Installations in Canada shall comply with the relevant requirements of the Canadian Electrical Code.
A Class 2 power supply unit has to be used for the installation in the USA and Canada.
3 Product description

3.1 Configuration

Type label

The type label contains the most important data for identification and use of the instrument:

Fig. 1: Layout of the type label (example)

1 Instrument type
2 Field for approvals
3 Power supply and signal output, electronics
4 Protection rating
5 Measuring range
6 Permissible process conditions
7 Material wetted parts
8 Product code
9 Order number
10 Serial number of the instrument
11 Symbol of the device protection class
12 ID numbers, instrument documentation
13 Reminder to observe the instrument documentation
14 SIL identification

Scope of this operating instructions manual

This operating instructions manual applies to the following instrument versions:

- Hardware from 1.0.0
- Software version from 1.2.2

Note:

You can find the hardware and software version of the instrument as follows:

- On the type plate of the electronics module
- In the adjustment menu under "Info"

Scope of delivery

The scope of delivery encompasses:

- Instrument CPT-2x
- Documentation
  - Quick setup guide CPT-2x
  - Safety Manual (SIL)
3 Product description

- Documentation instrument parameters (default values)
- Documentation order-relating instrument parameters (deviation from default values)
- Test certificate for pressure transmitters
- Instructions for optional instrument features
- Ex-specific "Safety instructions" (with Ex versions)
- If necessary, further certificates

Information:
Optional instrument features are also described in this operating instructions manual. The respective scope of delivery results from the order specification.

3.2 Principle of operation

Measured variables
The CPT-2x is suitable for the measurement of the following process variables:
- Process pressure
- Level

Fig. 2: Process pressure measurement CPT-2x

To reach the Safety Integrity Level (SIL) for the electronic differential pressure, both instruments must be SIL-qualified.

Application area
CPT-2x is suitable for applications in virtually all industries. It is used for the measurement of the following pressure types.
- Gauge pressure
- Absolute pressure
- Vacuum

Measured products
Measured products are gases, vapours and liquids. Depending on the process fitting and measurement setup, measured products can be also viscous or contain abrasive substances.

Measuring system pressure
Sensor element is the measuring cell with robust ceramic diaphragm. The process pressure deflects the ceramic diaphragm and causes a capacitance change in the measuring cell. This capacitance change
is converted into an electrical signal and outputted as measured value via the output signal.

![Configuration of the ceramic measuring cell](image)

**Fig. 3: Configuration of the ceramic measuring cell**

1. Process diaphragm
2. Glass joint
3. Base element

The measuring cell is available in two sizes: ø 28 mm and ø 17.5 mm.

**Use of ø 28 mm for example with:**
- Thread G½ EN 837 (manometer connection)
- Thread G1½, M44x1.25 and greater
- Flanges and hygienic fittings DN 32 and greater
- Measuring ranges 25 mbar and 100 bar

**Use of ø 17.5 mm for example with:**
- Thread G½ ISO 228-1 (front-flush), thread G¾ DIN 3852-E, thread G1 ISO 228-1
- Thread G1 suitable for PASVE
- Thread M30 x 1.5
- Flanges and hygienic fittings DN 25 and smaller

**Measuring system temperature**

A temperature sensor in the ceramic diaphragm of the ø 28 mm or on the ceramic base of the ø 17.5 mm measuring cell detects the actual process temperature. The temperature value is outputted via:
- The display and adjustment module
- The current output or the digital signal output

Extreme process temperature jumps are also immediately detected by the ø 28 mm measuring cell. The values are compared with that of an additional temperature measurement on the ceramic base body. Within only a few measuring cycles the intelligent sensor electronics compensates unavoidable measurement deviations due to temperature shocks. Such shocks cause (depending on the set damping) only slight, brief changes to the output signal.

**Pressure types**

The measuring cell design depends on the selected pressure type.

**Relative pressure:** the measuring cell is open to the atmosphere. The ambient pressure is detected in the measuring cell and compensated. It thus has no influence on the measured value.
Absolute pressure: the measuring cell is evacuated and encapsulated. The ambient pressure is not compensated and does hence influence the measured value.

Seal concepts

The following presentations show examples for the installation of the ceramic measuring cell into the process fitting and the different seal concepts.

Recessed installation

The recessed installation is particularly suitable for applications with gases, vapours and clear liquids. The measuring cell seal is positioned laterally as well as in addition in front.

![Fig. 4: Recessed installation of the measuring cell (example: manometer connection G½)](image)

1. Measuring cell
2. Seal for the measuring cell
3. Additional, front seal for measuring cell
4. Diaphragm
5. Process fitting
6. Seal for the process fitting

Front-flush mounting with single seal

The front-flush installation is particularly suitable for applications with viscous and abrasive media and in case of buildup. The measuring cell seal is positioned laterally.

![Fig. 5: Front-flush installation of the measuring cell (example: thread G1½)](image)

1. Seal for the process fitting
2. Measuring cell
3. Seal for the measuring cell
4. Process fitting
5. Diaphragm
3 Product description

**Completely front-flush mounting with single seal**

The completely front-flush mounting is particularly suitable for applications in the paper industry. The diaphragm is in the pulp flow, is hence cleaned and protected against buildup.

![Diagram of front-flush installation](image)

*Fig. 6: Front-flush installation of the measuring cell (example: M30 x 1.5)*

1. Measuring cell
2. Seal for the measuring cell
3. Seal for the process fitting
4. Process fitting
5. Diaphragm

**Front-flush mounting with double seal**

The front-flush installation is particularly suitable for applications with viscous media. The additional, front sealing protects the glass joint of the measuring cell against chemical attack and the measuring cell electronics against diffusion of aggressive gases from the process.

![Diagram of front-flush installation with double seal](image)

*Fig. 7: Front-flush installation of the measuring cell with double seal (example: flange connection with extension)*

1. Measuring cell
2. Seal for the measuring cell
3. Process fitting
4. Additional, front seal for measuring cell
5. Diaphragm

**Installation in hygienic fitting**

The front-flush, hygienic installation of the measuring cell is particularly suitable for food applications. The sealings are installed gap-free. The form seal of the measuring cell protects also the glass joint.
The front-flush, hygienic installation of the measuring cell acc. to 3A is particularly suitable for food applications. The sealings are installed gap-free. The additional front sealing for the measuring cell protects also the glass joint. A hole in the process fitting is used for leakage detection.

**3.3 Supplementary cleaning procedures**

The CPT-2x is also available in the version "Oil, grease and silicone-free". These instruments have passed through a special cleaning procedure to remove oil, grease and paint-wetting impairment substances (PWIS).

The cleaning is carried out on all wetted parts as well as on surfaces accessible from outside. To keep the purity level, the instruments are immediately packed in plastic foil after the cleaning process. The purity level remains as long as the instrument is kept in the closed original packaging.

**Caution:**

The CPT-2x in this version may not be used in oxygen applications. For this purpose, instruments are available in the special version "Oil and grease-free for oxygen applications".
3.4 SIL features

The CPT-2x 4 ... 20 mA/HART with SIL qualification differs from the standard instrument in the following points:

- Type label: with SIL logo
- Scope of delivery: with Safety Manual and documentation of the device parameters
- Parameter adjustment: Device status "Function Check" is outputted during the parameter adjustment, the safety function is deactivated
- Measured value output: "Failure" is outputted when the measured value < -20% or > +120% of the nominal measuring range
- Adjustment menu, "Current output": Failure mode 20.5 mA not selectable
- Adjustment menu, "HART mode": Selection "Analogue current output" is unmodifiably preset
- Electronics temperature: in case of temperature values outside the permitted range, "Failure" is outputted
- Some diaphragm coatings not permissible

Information:
The measures that must be implemented to use the instrument in safety-instrumented systems are described in the "Safety Manual". The SIL function can be deactivated neither by the user nor by service personnel.

3.5 Packaging, transport and storage

Packaging
Your instrument was protected by packaging during transport. Its capacity to handle normal loads during transport is assured by a test based on ISO 4180.

The packaging of standard instruments consists of environment-friendly, recyclable cardboard. For special versions, PE foam or PE foil is also used. Dispose of the packaging material via specialised recycling companies.

Transport
Transport must be carried out in due consideration of the notes on the transport packaging. Nonobservance of these instructions can cause damage to the device.

Transport inspection
The delivery must be checked for completeness and possible transit damage immediately at receipt. Ascertained transit damage or concealed defects must be appropriately dealt with.

Storage
Up to the time of installation, the packages must be left closed and stored according to the orientation and storage markings on the outside.

Unless otherwise indicated, the packages must be stored only under the following conditions:

- Not in the open
- Dry and dust free
- Not exposed to corrosive media
<table>
<thead>
<tr>
<th>3 Product description</th>
</tr>
</thead>
</table>
| - Protected against solar radiation  
- Avoiding mechanical shock and vibration |

**Storage and transport temperature**

- Storage and transport temperature see chapter "Supplement - Technical data - Ambient conditions"  
- Relative humidity 20 … 85 %

**Lifting and carrying**

With instrument weights of more than 18 kg (39.68 lbs) suitable and approved equipment must be used for lifting and carrying.
4 Mounting

4.1 General instructions

Suitability for the process conditions

Make sure before mounting that all parts of the instrument exposed to the process are suitable for the existing process conditions.

These are mainly:

- Active measuring component
- Process fitting
- Process seal

Process conditions in particular are:

- Process pressure
- Process temperature
- Chemical properties of the medium
- Abrasion and mechanical influences

You can find detailed information on the process conditions in chapter "Technical data" as well as on the type label.

Suitability for the ambient conditions

The instrument is suitable for standard and extended ambient conditions acc. to IEC/EN 61010-1.

Protection against moisture

Protect your instrument against moisture ingress through the following measures:

- Use a suitable connection cable (see chapter "Connecting to power supply")
- Tighten the cable gland or plug connector
- When mounting horizontally, turn the housing so that the cable gland or plug connector point downward
- Lead the connection cable downward in front of the cable entry or plug connector

This applies mainly to outdoor installations, in areas where high humidity is expected (e.g. through cleaning processes) and on cooled or heated vessels.

To maintain the housing protection, make sure that the housing lid is closed during operation and locked, if necessary.

Make sure that the degree of contamination specified in chapter "Technical data" meets the existing ambient conditions.

Screwing in

On instruments with threaded fitting, the hexagon must be tightened with a suitable wrench. For the proper wrench size see chapter "Dimensions".

Warning:

The housing must not be used to screw the instrument in! Applying tightening force can damage internal parts of the housing.

Vibrations

If there is strong vibration at the mounting location, the instrument version with external housing should be used. See chapter "External housing".
4 Mounting

Process pressure range - Mounting accessory

The permissible process pressure range is stated on the type label. The instrument should only be operated with these pressures if the mounting accessory used also fulfills these values. This should be ensured by suitable flanges, welded sockets, tension rings with Clamp connections, sealings, etc.

Temperature limits

Higher process temperatures often mean also higher ambient temperatures. Make sure that the upper temperature limits stated in chapter “Technical data” for the environment of the electronics housing and connection cable are not exceeded.

Filter element - Function

The filter element in the electronics housing has the following functions:

- Ventilation of the electronics housing
- Atmospheric pressure compensation (with relative pressure measuring ranges)

Caution:

The filter element causes a time-delayed pressure compensation. When quickly opening/closing the housing cover, the measured value can change for approx. 5 s by up to 15 mbar.

For an effective ventilation, the filter element must be always free from buildup. In case of horizontal mounting, turn the housing so that the filter element points downward after the instrument is installed. This provides better protection against buildup.

Caution:

Do not use a high-pressure cleaner. The filter element could be damaged, which would allow moisture into the housing.

The following paragraphs describe how the filter element is arranged in the different instrument versions.

Fig. 10: Temperature ranges

1 Process temperature
2 Ambient temperature

4.2 Ventilation and pressure compensation
Filter element - Position

Fig. 11: Position of the filter element
1 Plastic, stainless steel single chamber (precision casting)
2 Aluminium - single chamber
3 Stainless steel single chamber (electropolished)
4 Plastic double chamber
5 Aluminium - double chamber
6 Filter element

With the following instruments a blind plug is installed instead of the filter element:
- Instruments in protection IP 66/IP 68 (1 bar) - ventilation via capillaries in non-detachable cable
- Instruments with absolute pressure

Fig. 12: Position of the filter element - Ex-d version
1 Rotatable metal ring
2 Filter element

Instruments with absolute pressure have a blind plug mounted instead of the filter element.

→ Turn the metal ring in such a way that the filter element points downward after installation of the instrument. This provides better protection against buildup.
Filter element - Position
Second Line of Defense

The Second Line of Defense (SLOD) is a second level of the process separation in form of a gas-tight leadthrough in the housing neck, preventing products from penetrating into the housing.

With these instruments, the process assembly is completely encapsulated. An absolute pressure measuring cell is used so that no ventilation is required.

With relative pressure measuring ranges, the ambient pressure is detected and compensated by a reference sensor in the electronics.

![Fig. 13: Position of the filter element - gas-tight leadthrough](image)

1. Filter element
2. Gas-tight leadthrough

Filter element - Position
IP 69K version

Instruments with absolute pressure have a blind plug mounted instead of the filter element.

![Fig. 14: Position of the filter element - IP 69K version](image)

1. Filter element

4.3 Process pressure measurement

Keep the following in mind when setting up the measuring system:

- Mount the instrument above the measuring point

Possible condensation can then drain off into the process line.
Measurement setup in vapours

Keep the following in mind when setting up the measuring system:
- Connect via a siphon
- Do not insulate the siphon
- Fill the siphon with water before setup

A protective accumulation of water is formed through condensation in the pipe bends. Even in applications with hot steam, a medium temperature < 100 °C on the transmitter is ensured.
4 Mounting

**Measurement setup in liquids**

Keep the following in mind when setting up the measuring system:
- Mount the instrument below the measuring point

The effective pressure line is always filled with liquid and gas bubbles can bubble up to the process line.

![Fig. 17: Measurement setup for process pressure measurement of liquids in pipelines](image)

1. CPT-2x
2. Blocking valve
3. Pipeline

**Measurement setup**

Keep the following in mind when setting up the measuring system:
- Mount the instrument below the min. level
- Do not mount the instrument close to the filling stream or emptying area
- Mount the instrument so that it is protected against pressure shocks from the stirrer

![Fig. 18: Measurement setup for level measurement](image)
4.5 External housing

Configuration

**Fig. 19: Configuration, process module, external housing**

1. Pipeline
2. Process module
3. Connection cable process assembly - External housing
4. External housing
5. Signal cable

Mounting

1. Mark the holes according to the following drilling template
2. Fasten wall mounting plate with 4 screws

**Fig. 20: Drilling template - wall mounting plate**
5 Connecting to power supply

5.1 Preparing the connection

Safety instructions

Always keep in mind the following safety instructions:

- Carry out electrical connection by trained personnel authorised by the plant operator
- If overvoltage surges are expected, overvoltage arresters should be installed

Warning:
Connect only in the complete absence of line voltage.

Voltage supply

Power supply and current signal are carried on the same two-wire cable. The operating voltage can differ depending on the instrument version.

The data for power supply are specified in chapter "Technical data". Provide a reliable separation between the supply circuit and the mains circuits according to DIN EN 61140 VDE 0140-1.

Power the instrument via an energy-limited circuit acc. to IEC 61010-1, e.g. via Class 2 power supply unit.
Keep in mind the following additional factors that influence the operating voltage:

- Lower output voltage of the power supply unit under nominal load (e.g. with a sensor current of 20.5 mA or 22 mA in case of fault)
- Influence of additional instruments in the circuit (see load values in chapter "Technical data")

Connection cable

The instrument is connected with standard two-wire cable without screen. If electromagnetic interference is expected which is above the test values of EN 61326-1 for industrial areas, screened cable should be used.

Make sure that the cable used has the required temperature resistance and fire safety for max. occurring ambient temperature.

We generally recommend the use of screened cable for HART multidrop mode.

Use cable with round cross section for instruments with housing and cable gland. Use a cable gland suitable for the cable diameter to ensure the seal effect of the cable gland (IP protection rating).

Cable glands

Metric threads

In the case of instrument housings with metric thread, the cable glands are screwed in at the factory. They are sealed with plastic plugs as transport protection.

You have to remove these plugs before electrical connection.

NPT thread

In the case of instrument housings with self-sealing NPT threads, it is not possible to have the cable entries screwed in at the factory. The
Connecting to power supply

Free openings for the cable glands are therefore covered with red dust protection caps as transport protection.

Prior to setup you have to replace these protective caps with approved cable glands or close the openings with suitable blind plugs. On plastic housings, the NPT cable gland or the Conduit steel tube must be screwed into the threaded insert without grease.

Max. torque for all housings, see chapter "Technical data".

Cable screening and grounding

If screened cable is required, we recommend connecting the cable screen on both ends to ground potential. In the sensor, the screen must be connected directly to the internal ground terminal. The ground terminal on the outside of the housing must be connected to the ground potential (low impedance).

In Ex systems, the grounding is carried out according to the installation regulations.

In electroplating plants as well as plants for cathodic corrosion protection it must be taken into account that significant potential differences exist. This can lead to unacceptably high currents in the cable screen if it is grounded at both ends.

Information:
The metallic parts of the instrument (process fitting, sensor, concentric tube, etc.) are connected with the internal and external ground terminal on the housing. This connection exists either directly via the conductive metallic parts or, in case of instruments with external electronics, via the screen of the special connection cable.

You can find specifications on the potential connections inside the instrument in chapter "Technical data".

5.2 Connecting

The voltage supply and signal output are connected via the spring-loaded terminals in the housing.

Connection to the display and adjustment module or to the interface adapter is carried out via contact pins in the housing.

Information:
The terminal block is pluggable and can be removed from the electronics. To do this, lift the terminal block with a small screwdriver and pull it out. When reinserting the terminal block, you should hear it snap in.

Connection procedure

Proceed as follows:
1. Unscrew the housing lid
2. If a display and adjustment module is installed, remove it by turning it slightly to the left
3. Loosen compression nut of the cable gland and remove blind plug
4. Remove approx. 10 cm (4 in) of the cable mantle, strip approx. 1 cm (0.4 in) of insulation from the ends of the individual wires
5. Insert the cable into the sensor through the cable entry

![Fig. 21: Connection steps 5 and 6](image)

1 Single chamber housing
2 Double chamber housing

6. Insert the wire ends into the terminals according to the wiring plan

**Information:**
Solid cores as well as flexible cores with wire end sleeves are inserted directly into the terminal openings. In case of flexible cores without end sleeves, press the terminal from above with a small screwdriver, the terminal opening is then free. When the screwdriver is released, the terminal closes again.

You can find further information on the max. wire cross-section under "Technical data - Electromechanical data".

7. Check the hold of the wires in the terminals by lightly pulling on them
8. Connect the screen to the internal ground terminal, connect the external ground terminal to potential equalisation
9. Tighten the compression nut of the cable entry gland. The seal ring must completely encircle the cable
10. Reinsert the display and adjustment module, if one was installed
11. Screw the housing lid back on
The electrical connection is finished.

### 5.3 Single chamber housing

The following illustration applies to the non-Ex, Ex-ia and Ex-d version.
5 Connecting to power supply

Electronics and terminal compartment

**Fig. 22: Electronics and terminal compartment - single chamber housing**

1. Voltage supply, signal output
2. For display and adjustment module or interface adapter
3. For external display and adjustment unit or Slave sensor
4. Ground terminal for connection of the cable screen

5.4 Double chamber housing

The following illustrations apply to the non-Ex as well as to the Ex-ia version.

Electronics compartment

**Fig. 23: Electronics compartment - double chamber housing**

1. Internal connection to the terminal compartment

3. For external display and adjustment unit or Slave sensor
4. Ground terminal for connection of the cable screen

### 5.7 Switch-on phase

After connecting the instrument to power supply or after a voltage recurrence, the instrument carries out a self-check for approx. 5 s:

- Internal check of the electronics
- Indication of a status message on the display or PC
- Output signal at instruments with current output jumps to the set fault current
Then the actual measured value is outputted to the signal cable. The value takes into account settings that have already been carried out, e.g. default setting.
6 Functional safety (SIL)

6.1 Objective
In case of dangerous failures, processing facilities and machines can cause risks for persons, environment and property. The risk of such failures must be judged by the plant operator. Dependent thereon are measures for risk reduction through error prevention, error detection and fault control.

6.2 SIL qualification
When developing instruments that can be used in safety-instrumented systems, the focus is on avoiding systematical errors as well as determining and controlling random errors.

Here are the most important characteristics and requirements from the perspective of functional safety according to IEC 61508 (Edition 2):

- Internal monitoring of safety-relevant circuit parts
- Extended standardization of the software development
- In case of failure, switching of the safety-relevant outputs to a defined safe state
- Determination of the failure probability of the defined safety function
- Reliable parameterization with non-safe user environment
- Proof test

The SIL qualification of components is specified in a manual on functional safety (Safety Manual). Here, you can find all safety-relevant characteristics and information the user and the planner need for planning and operating the safety-instrumented system. This document is attached to each instrument with SIL rating and can be also found on our homepage via the instrument search.

6.3 Application area
The instrument can be used, for example, for process pressure and hydrostatic level measurement of liquids in safety-instrumented sys-

The following inputs/outputs are permitted:

- 4 … 20 mA current output

### 6.4 Safety concept of the parameterization

The following tools are permitted for parameterization of the safety function:

- The integrated display and adjustment unit for on-site adjustment
- The DTM suitable for the signal conditioning instrument in conjunction with an adjustment software according to the FDT/DTM standard, e.g. PACTware

**Note:**

For operation of the CPT-2x an actual DTM Collection is required. The modification of safety-relevant parameters is only possible with active connection to the instrument (online mode).

### Safe parameterization

To avoid possible errors during parameterisation in a non-safe operating environment, a verification procedure is used that enables reliable detection of parameter adjustment errors. The safety-relevant parameters have to be verified after they are saved in the instrument. In normal operating condition, the instrument is also protected (locked) against inadvertent or unauthorized parameter changes. This concept applies to adjustment directly on the instrument as well as adjustment with PACTware and DTM.

### Safety-relevant parameters

To prevent unintentional or unauthorized adjustment, the set parameters must be protected from unauthorized access. For this reason the instrument is shipped in locked condition. The PIN in delivery status is "0000".

When shipped with a specific parameter adjustment, the instruments are accompanied by a list with the values deviating from the basic setting.

All safety-relevant parameters must be verified after a change.

The parameter settings of the measurement loop must be documented. You can find a list of all safety-relevant parameters in the delivery status in chapter "Setup with the display and adjustment module" under "Additional adjustments - Reset". In addition, a list of the safety-relevant parameters can be stored and printed via PACTware/DTM.

### Unlock adjustment

For each parameter change, the instrument must be unlocked via a PIN (see chapter "Setup steps - Lock adjustment"). The device status is indicated by the symbol of an unlocked or locked padlock.

In delivery status, the PIN is 0000.

### Unsafe device status

**Warning:**

If adjustment is enabled, the safety function must be considered as unreliable. This applies until the parameterisation is terminated.
Correctly. If necessary, other measures must be taken to maintain the safety function.

**Change parameters**

All parameters changed by the operator are automatically stored temporarily so that they can be verified in the next step.

**Verify parameters/Lock adjustment**

After setup, the modified parameters must be verified (confirm the correctness of the parameters). To do this, you first have to enter the PIN. Here the adjustment is locked automatically. Then you carry out a comparison of two character strings. You must confirm that the character strings are identical. This is used to check the character presentation.

Then you confirm that the serial number of your instrument has been carried over correctly. This is used to check device communication.

Then, all modified parameters that have to be confirmed are listed. After this process is terminated, the safety function is again ensured.

**Incomplete process**

**Warning:**

If the described process was not carried out completely or correctly (e.g. due to interruption or voltage loss), the instrument remains in an unlocked, and thus unsafe, status.

**Instrument reset**

**Warning:**

In case of a reset to basic settings, all safety-relevant parameters will also be reset to default. Therefore all safety-relevant parameters must be checked or readjusted.
7 Set up with the display and adjustment module

7.1 Insert display and adjustment module

The display and adjustment module can be inserted into the sensor and removed again at any time. You can choose any one of four different positions - each displaced by 90°. It is not necessary to interrupt the power supply.

Proceed as follows:

1. Unscrew the housing lid
2. Place the display and adjustment module on the electronics in the desired position and turn it to the right until it snaps in.
3. Screw housing lid with inspection window tightly back on

Disassembly is carried out in reverse order.

The display and adjustment module is powered by the sensor, an additional connection is not necessary.

Fig. 30: Installing the display and adjustment module in the electronics compartment of the single chamber housing
7 Set up with the display and adjustment module

**Fig. 31: Installing the display and adjustment module in the double chamber housing**

1. In the electronics compartment
2. In the terminal compartment

**Note:**
If you intend to retrofit the instrument with a display and adjustment module for continuous measured value indication, a higher lid with an inspection glass is required.

### 7.2 Adjustment system

**Fig. 32: Display and adjustment elements**

1. LC display
2. Adjustment keys

**Key functions**

- **[OK] key:**
  - Move to the menu overview
  - Confirm selected menu
  - Edit parameter
  - Save value

- **[->] key:**
  - Change measured value presentation
  - Select list entry
  - Select menu items in the quick setup menu
7 Set up with the display and adjustment module

- Select editing position

- [+] key:
  - Change value of the parameter

- [ESC] key:
  - Interrupt input
  - Jump to next higher menu

Adjustment system

The instrument is operated via the four keys of the display and adjustment module. The individual menu items are shown on the LC display. You can find the function of the individual keys in the previous illustration.

Time functions

When the [+] and [->] keys are pressed quickly, the edited value, or the cursor, changes one value or position at a time. If the key is pressed longer than 1 s, the value or position changes continuously.

When the [OK] and [ESC] keys are pressed simultaneously for more than 5 s, the display returns to the main menu. The menu language is then switched over to "English".

Approx. 60 minutes after the last pressing of a key, an automatic reset to measured value indication is triggered. Any values not confirmed with [OK] will not be saved.

7.3 Measured value indication

With the [->] key you can move between three different indication modes.

In the first view, the selected measured value is displayed in large digits.

In the second view, the selected measured value and a corresponding bar graph presentation are displayed.

In the third view, the selected measured value as well as a second selectable value, e.g. the temperature, are displayed.

With the "OK" key you move (during the initial setup of the instrument) to the selection menu "Language".

Selection language

In this menu item, you can select the national language for further parameterization.

With the "[->]" button, you can select the requested language, with "OK" you confirm the selection and move to the main menu.
You can change your selection afterwards with the menu item "Setup - Display, Menu language".

### 7.4 Parameter adjustment

#### Main menu

The main menu is divided into five sections with the following functions:

- **Setup**: Settings, e.g., for measurement loop name, application, units, position correction, adjustment, signal output
- **Display**: Settings, e.g., for language, measured value display, lighting
- **Diagnosis**: Information, e.g., on instrument status, pointer, measurement reliability, simulation
- **Additional adjustments**: PIN, date/time, reset, copy function
- **Info**: Instrument name, hardware and software version, date of manufacture, sensor features

Note:

For optimum adjustment of the measuring point, the individual submenu items in the main menu item "Setup" should be selected one after the other and provided with the correct parameters. If possible, go through the items in the given sequence.

The submenu points are described below.

#### Operating sequence

A parameter change with SIL qualified instruments must always be carried out as follows:

- Unlock adjustment
- Change parameters
- Lock adjustment and verify modified parameters

This ensures that all modified parameters have been deliberately changed.

**Unlock adjustment**

The instrument is shipped in locked condition.

To prevent unintentional or unauthorized adjustment, the instrument is protected (locked) against all parameter changes while in normal operating condition.

For each parameter change you have to enter the PIN of the instrument. In delivery status, the PIN is "0000".

**Change parameters**

You can find a description below the respective parameter.
7 Set up with the display and adjustment module

Lock adjustment and verify modified parameters
You can find a description below the parameter "Setup - Lock adjustment".

Setup - Measurement loop name
In the menu item "Sensor TAG" you edit a twelve-digit measurement loop designation.
You can enter an unambiguous designation for the sensor, e.g. the measurement loop name or the tank or product designation. In digital systems and in the documentation of larger plants, a singular designation must be entered for exact identification of individual measuring points.

The available digits include:
- Letters from A … Z
- Numbers from 0 … 9
- Special characters +, -, /, -

Setup - Application
In this menu item you activate/deactivate the slave sensor for electronic differential pressure and select the application.

CPT-2x can be used for process pressure and level measurement. Default setting is process pressure measurement. The mode can be changed in this adjustment menu.
If you have connected no slave sensor, you confirm this with "Deactivate".
Depending on the selected application, different subchapters in the following adjustment steps are important. There you can find the individual adjustment steps.

Enter the requested parameters via the appropriate keys, save your settings with [OK] and jump to the next menu item with the [ESC] and the [->] key.

Setup - Units
In this menu item, the adjustment units of the instrument are determined. The selection determines the unit displayed in the menu items "Min. adjustment (Zero)" and "Max. adjustment (Span)".

Unit of measurement:
If the level should be adjusted in a height unit, the density of the medium must also be entered later during the adjustment.
In addition, the temperature unit of the instrument is specified. The selection determines the unit displayed in menu items "Peak value, temperature" and "in the variables of the digital output signal".

**Temperature unit:**

Enter the requested parameters via the appropriate keys, save your settings with [OK] and jump to the next menu item with the [ESC] and the [->] key.

**Setup - Position correction**

Especially with chemical seal systems, the installation position of the instrument can shift (offset) the measured value. Position correction compensates this offset. In the process, the actual measured value is taken over automatically. With relative pressure measuring cells a manual offset can also be carried out.

If the actual measured value should be taken over as correction value during automatic position correction, this value must not be influenced by product coverage or static pressure.

With the manual position correction, the offset value can be determined by the user. Select for this purpose the function "Edit" and enter the requested value.

Save your settings with [OK] and move with [ESC] and [->] to the next menu item.

After the position correction is carried out, the actual measured value is corrected to 0. The corrective value appears with an inverse sign as offset value in the display.

The position correction can be repeated as often as necessary. However, if the sum of the corrective values exceeds 20 % of the nominal measuring range, then no position correction is possible.

**Setup - Adjustment**

CPT-2x always measures pressure independently of the process variable selected in the menu item "Application". To output the selected process variable correctly, an allocation of the output signal to 0 % and 100 % must be carried out (adjustment).

With the application "Level", the hydrostatic pressure, e.g. with full and empty vessel, is entered for adjustment. See following example:
Fig. 33: Parameter adjustment example "Min./max. adjustment, level measurement"

1. Min. level = 0 % corresponds to 0.0 mbar
2. Max. level = 100 % corresponds to 490.5 mbar

If these values are not known, an adjustment with filling levels of e.g. 10 % and 90 % is also possible. By means of these settings, the real filling height is then calculated.

The actual product level during this adjustment is not important, because the min./max. adjustment is always carried out without changing the product level. These settings can be made ahead of time without the instrument having to be installed.

**Note:**

If the adjustment ranges are exceeded, the entered value will not be accepted. Editing can be interrupted with [ESC] or corrected to a value within the adjustment ranges.

For the other process variables such as e.g. process pressure, differential pressure or flow, the adjustment is performed in like manner.

**Setup - Zero adjustment**

Proceed as follows:

1. Select the menu item "Setup" with [->] and confirm with [OK].
   Now select with [->] the menu item "Zero adjustment" and confirm with [OK].

2. Edit the mbar value with [OK] and set the cursor to the requested position with [->].

3. Set the requested mbar value with [+] and store with [OK].
4. Go with [ESC] and [->] to the span adjustment
   The zero adjustment is finished.

   **Information:**
   The Zero adjustment shifts the value of the span adjustment. The span, i.e. the difference between these values, however, remains unchanged.

   For an adjustment with pressure, simply enter the actual measured value indicated at the bottom of the display.

   If the adjustment ranges are exceeded, the message "Outside parameter limits" appears. The editing procedure can be aborted with [ESC] or the displayed limit value can be accepted with [OK].

**Setup - Span adjustment**

Proceed as follows:

1. Select with [->] the menu item Span adjustment and confirm with [OK].

2. Edit the mbar value with [OK] and set the cursor to the requested position with [->].

3. Set the requested mbar value with [+] and store with [OK].

   For an adjustment with pressure, simply enter the actual measured value indicated at the bottom of the display.

   If the adjustment ranges are exceeded, the message "Outside parameter limits" appears. The editing procedure can be aborted with [ESC] or the displayed limit value can be accepted with [OK].

   The span adjustment is finished.

**Setup - Min. adjustment**

Proceed as follows:

1. Select the menu item "Setup" with [->] and confirm with [OK].
   Now select with [->] the menu item "Adjustment", then "Min. adjustment" and confirm with [OK].

2. Edit the percentage value with [OK] and set the cursor to the requested position with [->].

3. Set the requested percentage value (e.g. 10 %) with [+] and save with [OK]. The cursor jumps now to the pressure value.

4. Enter the pressure value corresponding to the min. level (e.g. 0 mbar).
5. Save settings with [OK] and move with [ESC] and [-] to the max. adjustment.

The min. adjustment is finished.
For an adjustment with filling, simply enter the actual measured value indicated at the bottom of the display.

**Setup - Max. adjustment**

**Level**

Proceed as follows:
1. Select with [-] the menu item Max. adjustment and confirm with [OK].

2. Edit the percentage value with [OK] and set the cursor to the requested position with [-].

3. Set the requested percentage value (e.g. 90%) with [+] and save with [OK]. The cursor jumps now to the pressure value.

4. Enter the pressure value for the full vessel (e.g. 900 mbar) corresponding to the percentage value.

5. Save settings with [OK]

The max. adjustment is finished.
For an adjustment with filling, simply enter the actual measured value indicated at the bottom of the display.

**Setup - Damping**

To damp process-dependent measured value fluctuations, set an integration time of 0 ... 999 s in this menu item. The increment is 0.1 s.

The default setting depends on the sensor type.

**Setup - Linearisation**

A linearization is necessary for all vessels in which the vessel volume does not increase linearly with the level - e.g. a horizontal cylindrical or spherical tank - and the indication or output of the volume is required. Corresponding linearization curves are preprogrammed for these vessels. They represent the correlation between the level percentage and vessel volume. The linearization applies to the measured value indication and the current output.

**Setup - Current output (mode)**

In the menu item "Current output mode" you determine the output characteristics and reaction of the current output in case of fault.
Setup - Current output (Min./Max.)

The default setting is output characteristics 4 ... 20 mA, fault mode < 3.6 mA.

Setup - Lock adjustment

With this menu item you safeguard the sensor parameters against unauthorized or unintentional modifications.

To avoid possible errors during parameter adjustment in a non-safe environment, a verification procedure is used that enables reliable detection of parameter adjustment errors. In this procedure, safety-relevant parameters are verified before saving them in the instrument.

In addition, as a protection against unintentional or unauthorized adjustment, the instrument is locked against all parameter changes in normal operating condition.

1. Enter PIN

The instrument is shipped in locked condition. The PIN in the delivery status is "0000".

2. Character string comparison

You then have to carry out the character string comparison. This is used to check the character presentation.

Confirm if the two character strings are identical. The verification texts are provided in German and in the case of all other menu languages, in English.

3. Serial number acknowledgement

The serial number is verified.

The verification texts are provided in German and in the case of all other menu languages, in English.
7 Set up with the display and adjustment module

Afterwards you confirm that the serial number of your instrument was carried over correctly. This is used to check device communication.

4. Verify parameters
All safety-relevant parameters must be verified after a change:
- SIL parameter 1: Zero adjustment
- SIL parameter 2: Slave on/off
- Non-SIL parameter 1: Measured value presentation
- Non-SIL parameter 2: Display value 1, unit of the application
- Non-SIL parameter 3: Menu language
- Non-SIL parameter 4: Lighting

Confirm the modified values one after the other.

If the described process of parameter adjustment was run through completely and correctly, the instrument will be locked and hence ready for operation.

Otherwise the instrument remains in the released and hence unsafe condition.

Information:
As long as the CPT-2x is powered, the display and adjustment module remains in the actually set adjustment menu. An automatic, time-controlled reset to the measured value indication is not carried out.

Display - Language
This menu item enables the setting of the requested national language.

The following languages are available:
- German
- English
- French
- Spanish
- Russian
- Italian
- Dutch
- Portuguese
- Japanese
- Chinese
- Polish
7 Set up with the display and adjustment module

- Czech
- Turkish

In delivery status, the CPT-2x is set to English.

**Display - Displayed value 1 and 2**

In this menu item, you define which measured value is displayed.

The default setting for the display value is "Lin. percent".

**Display - Display format 1 and 2**

In this menu item you define the number of decimal positions with which the measured value is displayed.

The default setting for the display format is "Automatic".

**Display - Backlight**

The display and adjustment module has a backlight for the display. In this menu item you can switch on the lighting. You can find the required operating voltage in chapter "Technical data".

In delivery status, the lighting is switched on.

**Diagnostics - Device status**

In this menu item, the device status is displayed.

In case of error, e.g. the error code F017, e.g. the error description "Adjustment span too small" and a four digit figure are displayed for service purposes. You can find the error codes with description, reason as well as rectification in chapter "Asset Management".

**Diagnostics - Peak values, pressure**

The respective min. and max. measured values are saved in the sensor. The two values are displayed in menu item "Peak values, pressure".

In another window you can carry out a reset of the peak values separately.
Diagnostics - Peak values, temperature

The respective min. and max. measured values of the measuring cell and the electronics temperature are stored in the sensor. In menu item "Peak value, temperature", both values are displayed.

In another window you can carry out a reset of the two peak values separately.

<table>
<thead>
<tr>

<td></td>
</tr>
</tbody>
</table>

Diagnosis - Simulation

In this menu item you can simulate measured values via the current output. This allows the signal path to be tested, e.g. through downstream indicating instruments or the input card of the control system.

- **Activate simulation?**
- **Deactivate simulation?**

Select the requested simulation variable and set the requested value.

To deactivate the simulation, you have to push the [ESC] key and confirm the message "Deactivate simulation" with the [OK] key.

⚠️ **Caution:**
During simulation, the simulated value is outputted as 4...20 mA current value and digital HART signal.

ℹ️ **Information:**
Without manual deactivation, the sensor terminates the simulation automatically after 60 minutes.

Additional settings - Date/Time

In this menu item, you adjust the internal clock of the sensor. There is no adjustment for summer/winter (daylight saving) time.

<table>

The following reset functions are available:

**Delivery status:** Restores the parameter settings at the time of shipment from the factory, incl. the order-specific settings. Any user-
defined linearisation curve as well as the measured value memory are deleted.

**Basic settings:** Resets the parameter settings, incl. special parameters, to the default values of the respective instrument. Any programmed linearisation curve as well as the measured value memory are deleted.

The following table shows the default values of the instrument. Depending on the instrument version or application, all menu items may not be available or some may be differently assigned:

The safety-relevant menu items having to do with functional safety according to IEC 61508 (Edition 2) are marked with "SIL".

Additional settings - Copy instrument settings

The instrument settings are copied with this function. The following functions are available:

- Read from sensor: Read data from sensor and save in the display and adjustment module
- Write to sensor: Save data from the display and adjustment module back into the sensor

The following data or settings for adjustment of the display and adjustment module are saved:

- All data of the menu "Setup" and "Display"
- In the menu "Additional adjustments" the items "Reset, Date/Time"
- The user-programmable linearization curve
The copied data are permanently saved in an EEPROM memory in the display and adjustment module and remain there even in case of power failure. From there, they can be written into one or more sensors or kept as backup for a possible electronics exchange.

**Note:**
Before the data are saved in the sensor, a safety check is carried out to determine if the data match the sensor. In the process the sensor type of the source data as well as the target sensor are displayed. If the data do not match, a fault message is outputted or the function is blocked. The data are saved only after release.

**Additional settings - Scaling (1)**
In menu item "Scaling" you define the scaling variable and the scaling unit for the level value on the display, e.g. volume in l.

**Additional settings - Scaling (2)**
In menu item "Scaling (2)" you define the scaling format on the display and the scaling of the measured level value for 0 % and 100 %.

**Additional output - Current output**
In the menu items "Current output" you determine the properties of the current output.

On instruments with integrated additional current output, the properties for each current output are adjusted individually. The following descriptions apply to both current outputs.

The additional current output cannot be used as an output in the sense of a safety-instrumented application (SIL).

**Additional settings - Current output 1 and 2 (size)**
In menu item "Current output, variable" you specify which measured variable the current output refers to.

For instruments with SIL qualification, the selection is limited to lin. percent.

**Additional adjustments - HART mode**
The sensor is preset to the HART mode "Analogue current output".
For instruments with SIL qualification, this parameter cannot be modified.

### Additional settings - Special parameters

In this menu item you gain access to the protected area where you can enter special parameters. In exceptional cases, individual parameters can be modified in order to adapt the sensor to special requirements.

Change the settings of the special parameters only after having contacted our service staff.

### Info - Instrument name

In this menu item, you can read out the instrument name and the instrument serial number:

### Info - Instrument version

In this menu item, the hardware and software version of the sensor is displayed.

### Info - Factory calibration date

In this menu item, the date of factory calibration of the sensor as well as the date of the last change of sensor parameters are displayed via the display and adjustment module or via the PC.

### Info - Sensor characteristics

In this menu item, the features of the sensor such as approval, process fitting, seal, measuring range, electronics, housing and others are displayed.
7.5 Saving the parameterisation data

We recommend writing down the adjustment data, e.g. in this operating instructions manual, and archiving them afterwards. They are thus available for multiple use or service purposes.

- **On paper**

- **In the display and adjustment module**

  If the instrument is equipped with a display and adjustment module, the parameter adjustment data can be saved therein. The procedure is described in menu item "Copy device settings".
8 Setup with PACTware

8.1 Connect the PC

Connecting the PC to the signal cable

![Diagram of connecting the PC to the signal cable]

Fig. 34: Connecting the PC to the signal cable

1. RS232 connection
2. HART resistor 250 Ω
3. CPT-2x

Necessary components:
- CPT-2x
- PC with PACTware and suitable WIKA DTM
- HART modem
- HART resistance approx. 250 Ω
- Power supply unit

Note:
For power supply units with integrated HART resistance (inner resistance approx. 250 Ω), there is no additional external resistance necessary. Standard Ex separators are often provided with a sufficiently high current limitation resistance. In such cases, the modem can be connected in parallel to the 4 … 20 mA cable.

8.2 Parameter adjustment

The further setup steps with detailed descriptions can be found in the online help of PACTware and the DTMs.

Note:
Keep in mind that for the setup of model CPT-2x, the current version of the DTM-Collection must be used.

The latest DTM Collection and PACTware version can be downloaded free of charge via the Internet.
8.3 Saving the parameterisation data

We recommend documenting or saving the parameterisation data via PACTware. That way the data are available for multiple use or service purposes.
9 Diagnosis, asset management and service

9.1 Maintenance

If the device is used properly, no special maintenance is required in normal operation.

In some applications, product buildup on the diaphragm can influence the measuring result. Depending on the sensor and application, take precautions to ensure that heavy buildup, and especially a hardening thereof, is avoided.

Proof test

To identify possible undetected, dangerous failures, the safety function of the instrument must be checked in adequate intervals by a proof test.

During the function test, the safety function must be treated as unsafe. Keep in mind that the function test influences downstream connected devices.

If one of the tests proves negative, the entire measuring system must be switched out of service and the process held in a safe state by means of other measures.

You can find detailed information on the proof test in the Safety Manual (SIL).

9.2 Cleaning - hygienic connection with compression nut

Overview

The hygienic connection with compression nut can be disassembled and the diaphragm cleaned.

The following graphic shows the structure:

![Fig. 35: CPT-2x, structure of the hygienic connection with compression nut](image)

1 Hexagon
2 Compression nut
3 Process fitting
4 Process module
5 Form seal for the measuring cell
6 O-ring seal for the process fitting
7 Diaphragm

Procedure

To do so, proceed as follows:

1. Loosen compression nut and remove the pressure transmitter from the welded socket
2. Remove the O-ring seal for the process fitting
3. Clean the diaphragm with brass brush and cleaning detergent
4. Loosen the hexagon and remove the process component from the process fitting
5. Remove the form seal for the measuring cell and remove it by a new one
6. Screw the process component into the process fitting, tighten the hexagon (wrench size see chapter "Dimensions", max. torque see chapter "Technical data")
7. Insert new O-ring seal for the process fitting
8. Install the process pressure transmitter in the welded socket, tighten compression nut

The cleaning is finished.
The pressure transmitter is directly ready for operation, a fresh adjustment is not required.

9.3 Diagnosis memory
The instrument has several memories available for diagnostic purposes. The data remain there even in case of voltage interruption.

Measured value memory
Up to 100,000 measured values can be stored in the sensor in a ring memory. Each entry contains date/time as well as the respective measured value.

Depending on the instrument version, values that can be stored are for example:

- Level
- Process pressure
- Differential pressure
- Static pressure
- Percentage value
- Scaled values
- Current output
- Lin. percent
- Measuring cell temperature
- Electronics temperature

When the instrument is shipped, the measured value memory is active and stores pressure value and measuring cell temperature every 10 s, with electronic differential pressure also the static pressure.

The requested values and recording conditions are set via a PC with PACTware/DTM or the control system with EDD. Data are thus read out and also reset.

Event memory
Up to 500 events are automatically stored with a time stamp in the sensor (non-deletable). Each entry contains date/time, event type, event description and value. Event types are for example:

- Modification of a parameter
- Switch-on and switch-off times
- Status messages (according to NE 107)
- Error messages (according to NE 107)
The data are read out via a PC with PACTware/DTM or the control system with EDD.

### 9.4 Asset Management function

The instrument features self-monitoring and diagnostics according to NE 107 and VDI/VDE 2650. In addition to the status messages in the following tables, detailed error messages are available under menu item "Diagnostics" via the display and adjustment module, PACTware/DTM and EDD.

#### Status messages

The status messages are divided into the following categories:

- Failure
- Function check
- Out of specification
- Maintenance requirement

and explained by pictographs:

![Pictographs of the status messages](image)

1. **Failure** - red
2. **Out of specification** - yellow
3. **Function check** - orange
4. **Maintenance** - blue

**Failure:** Due to a malfunction in the instrument, a fault message is outputted.

This status message is always active. It cannot be deactivated by the user.

**Function check:** The instrument is being worked on, the measured value is temporarily invalid (for example during simulation).

This status message is active by default. It can be deactivated by the user via PACTware/DTM or EDD.

**Out of specification:** The measured value is unreliable because an instrument specification was exceeded (e.g. electronics temperature).

This status message is inactive by default. It can be activated by the user via PACTware/DTM or EDD.

**Maintenance:** Due to external influences, the instrument function is limited. The measurement is affected, but the measured value is still valid. Plan in maintenance for the instrument because a failure is expected in the near future (e.g. due to buildup).

This status message is active by default. It can be deactivated by the user via PACTware/DTM or EDD.
## Failure

<table>
<thead>
<tr>
<th>Code</th>
<th>Text message</th>
<th>Cause</th>
<th>Rectification</th>
<th>DevSpec State in CMD 48</th>
</tr>
</thead>
</table>
| F013   | No valid measured value available                | ● Gauge pressure or low pressure  
● Measuring cell defective | ● Exchange measuring cell  
● Send instrument for repair | Bit 0 of Byte 0 … 5 |
| F017   | Adjustment span too small                        | ● Adjustment not within specification | ● Change the adjustment according to the limit values | Bit 1 of Byte 0 … 5 |
| F025   | Error in the linearization table                 | ● Index markers are not continuously rising, for example illogical value pairs | ● Check linearisation table  
● Delete table/Create new | Bit 2 of Byte 0 … 5 |
| F036   | no operable sensor software                      | ● Failed or interrupted software update | ● Repeat software update  
● Check electronics version  
● Exchanging the electronics  
● Send instrument for repair | Bit 3 of Byte 0 … 5 |
| F040   | Error in the electronics                         | ● Hardware defect             | ● Exchanging the electronics  
● Send instrument for repair | Bit 4 of Byte 0 … 5 |
| F041   | Communication error                              | ● No connection to the sensor electronics | ● Check connection between sensor and main electronics (with separate version) | Bit 5 of Byte 0 … 5 |

• If necessary, increase operating voltage | Bit 23-1 of Byte 14 … 24 |
| S605  | Impermissible pressure value     | • Measured process pressure below or above the adjustment range | • Check nominal measuring range of the instrument  
• If necessary, use an instrument with a higher measuring range | Bit 23-2 of Byte 14 … 24 |

*Tab. 7: Error codes and text messages, information on causes as well as corrective measures*
9.5 Rectify faults

The operator of the system is responsible for taking suitable measures to rectify faults.

Procedure for fault rectification

The first measures are:

- Evaluation of fault messages via the adjustment device
- Checking the output signal
- Treatment of measurement errors

Further comprehensive diagnostics options are available with a PC with PACTware and the suitable DTM. In many cases, the reasons can be determined in this way and faults rectified.

Check the 4 ... 20 mA signal

Connect a multimeter in the suitable measuring range according to the wiring plan. The following table describes possible errors in the current signal and helps to eliminate them:

<table>
<thead>
<tr>
<th>Error</th>
<th>Cause</th>
<th>Rectification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4 ... 20 mA signal not stable</td>
<td>Fluctuating measured value</td>
<td>Set damping</td>
</tr>
<tr>
<td>4 ... 20 mA signal missing</td>
<td>Electrical connection faulty</td>
<td>Check connection, correct, if necessary</td>
</tr>
<tr>
<td></td>
<td>Voltage supply missing</td>
<td>Check cables for breaks; repair if necessary</td>
</tr>
<tr>
<td></td>
<td>Operating voltage too low, load resistance too high</td>
<td>Check, adapt if necessary</td>
</tr>
</tbody>
</table>
**9 Diagnosis, asset management and service**

<table>
<thead>
<tr>
<th>Error</th>
<th>Cause</th>
<th>Rectification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current signal greater than 22 mA, less than 3.6 mA</td>
<td>• Sensor electronics defective</td>
<td>• Exchange the instrument or send it in for repair</td>
</tr>
</tbody>
</table>

**Reaction after fault rectification**

Depending on the reason for the fault and the measures taken, the steps described in chapter "Setup" must be carried out again or must be checked for plausibility and completeness.

**9.6 Exchange process module on version IP 68 (25 bar)**

On version IP 68 (25 bar), the user can exchange the process module on site. Connection cable and external housing can be kept.

Required tools:
- Hexagon key wrench, size 2

**Caution:**

⚠️ The exchange may only be carried out in the complete absence of line voltage.

⚠️ In Ex applications, only a replacement part with appropriate Ex approval may be used.

**Caution:**

⚠️ During exchange, protect the inner side of the parts against contamination and moisture.

Proceed as follows when carrying out the exchange:

1. Loosen the fixing screw with the hexagon key wrench
2. Carefully detach the cable assembly from the process module

**Fig. 37: CPT-2x in IP 68 version, 25 bar and lateral cable outlet, external housing**

1. Process module
2. Plug connector
3. Fixing screw
4. Cable assembly
5. Connection cable
6. External housing

3. Loosen the plug connector
4. Mount the new process module on the measuring point
5. Plug the connector back in
6. Mount the cable assembly on the process module and turn it to the desired position
7. Tighten the fixing screw with the hexagon key wrench

The exchange is finished.

### 9.7 Instrument repair

You can find information for a return shipment under "Service" on our local website.

If a repair is necessary, please proceed as follows:

- Complete one form for each instrument
- If necessary, state a contamination
- Clean the instrument and pack it damage-proof
- Attach the completed form and possibly also a safety data sheet to the instrument
10 Dismount

10.1 Dismounting steps

Warning:
Before dismounting, be aware of dangerous process conditions such as e.g. pressure in the vessel or pipeline, high temperatures, corrosive or toxic products etc.

Take note of chapters "Mounting" and "Connecting to power supply" and carry out the listed steps in reverse order.

10.2 Disposal

The instrument consists of materials which can be recycled by specialised recycling companies. We use recyclable materials and have designed the electronics to be easily separable.

Correct disposal avoids negative effects on humans and the environment and ensures recycling of useful raw materials.

Materials: see chapter "Technical data"

If you have no way to dispose of the old instrument properly, please contact us concerning return and disposal.

WEEE directive 2012/19/EU

This instrument is not subject to the WEEE directive 2012/19/EU and the respective national laws. Pass the instrument directly on to a specialised recycling company and do not use the municipal collecting points. These may be used only for privately used products according to the WEEE directive.
11 Supplement

11.1 Technical data

Note for approved instruments

The technical data in the respective safety instructions are valid for approved instruments (e.g. with Ex approval). These data can differ from the data listed herein - for example regarding the process conditions or the voltage supply.

Housing

- Plastic housing Plastic PBT (Polyester)
- Aluminium die-cast housing Aluminium die-casting AlSi10Mg, powder-coated - basis: Polyester
- Stainless steel housing 316L
- Cable gland PA, stainless steel, brass
- Sealing, cable gland NBR
- Blind plug, cable gland PA
- Seal between housing and housing lid Silicone SI 850 R, NBR silicone-free
- Inspection window in housing cover Polycarbonate, UL746-C listed (with Ex-d version: glass)
- Ground terminal 316L

External housing
- Housing Plastic PBT (Polyester), 316L
- Socket, wall mounting plate Plastic PBT (Polyester), 316L
- Seal between base and wall mounting plate EPDM (fixed connected)

Seal between housing and housing lid Silicone SI 850 R, NBR silicone-free, EPDM (coating-compatible)

Inspection window in housing cover Polycarbonate, UL746-C listed (with Ex-d version: glass)

Ground terminal 316Ti/316L

Connection cable with IP 68 (25 bar) version
- Cable cover PE, PUR
- Type label support on cable PE hard

Connection cable with IP 68 (1 bar) version
PE, PUR

Weights
Total weight CPT-2x approx. 0.8 ... 8 kg (1.764 ... 17.64 lbs), depending on process fitting and housing

Torques
Max. torque for process fitting
- G½, G¾ 30 Nm (22.13 lbf ft)
- Fittings according to 3A with exchangeable sealing 20 Nm (14.75 lbf ft)
- Hygienic fitting with compression nut (hexagon) 40 Nm (29.50 lbf ft)
- G1, M30 x 1.5 50 Nm (36.88 lbf ft)
- G1 for PASVE 100 Nm (73.76 lbf ft)
- G1½ 200 Nm (147.5 lbf ft)

Max. torque for screws
- PMC 1", PMC 1½" 2 Nm (1.475 lbf ft)
- PMC 1½" 5 Nm (3.688 lbf ft)

Max. torque for NPT cable glands and Conduit tubes
- Plastic housing 10 Nm (7.376 lbf ft)
- Aluminium/Stainless steel housing 50 Nm (36.88 lbf ft)

Input variable
The specifications are only an overview and refer to the measuring cell. Limitations due to the material and version of the process fitting as well as the selected pressure type are possible. The specifications on the nameplate apply.

1) Between transmitter and external electronics housing.
2) Fix connected to the sensor.

**Adjustment ranges**

Specifications refer to the nominal measuring range, pressure values lower than -1 bar cannot be set.
Min./Max. adjustment:
- Percentage value -10 ... 110 %
- Pressure value -20 ... 120 %

Zero/Span adjustment:
- Zero -20 ... +95 %
- Span -120 ... +120 %
- Difference between zero and span max. 120 % of the nominal range

Max. permissible Turn Down Unlimited (recommended 20 : 1)
Max. permissible turn down with SIL applications 10 : 1

### Switch-on phase

Run-up time with operating voltage $U_B$
- $\geq 12$ V DC $\leq 9$ s
- $< 12$ V DC $\leq 22$ s

Staring current (for run-up time) $\leq 3.6$ mA

### Output variable

For details on the operating voltage see chapter "Voltage supply"

Output signal 4 ... 20 mA/HART
Range of the output signal 3.8 ... 20.5 mA/HART (default setting)
Fulfilled HART specification 7.3
Signal resolution 0.3 µA
Fault signal, current output (adjustable) $\geq 21$ mA, $\leq 3.6$ mA, last valid measured value

Max. output current 21.5 mA
Load See load resistance under Power supply
Starting current $\leq 10$ mA for 5 ms after switching on, $\leq 3.6$ mA
Damping (63 % of the input variable), adjustable 0 ... 999 s

HART output values according to HART 7 (default setting)
- First HART value (PV) Linear percentage value
- Second HART value (SV) Measuring cell temperature (ceramic measuring cell)
- Third HART value (TV) Pressure
- Fourth HART value (QV) Electronics temperature

### Dynamic behaviour output

Dynamic characteristics depending on medium and temperature

---

3) Last valid measured value not possible with SIL.
4) The output values can be assigned individually.
## 11 Supplement

</tbody>
</table>

**Damping** (63% of the input variable) 0 ... 999 s, adjustable via menu item "Damping"

### Additional output parameter - Measuring cell temperature

- **Detection area**: -60 ... +150 °C (-76 ... +302 °F)
- **Resolution**: < 0.2 K
- **Accuracy**
  - In the range of 0 ... +100 °C (+32 ... +212 °F) ±2 K
  - In the range of -60 ... 0 °C (-76 ... +32 °F) and +100 ... +150 °C (+212 ... +302 °F) typ. ±4 K

### Output of the temperature values

- **Analogue**: Via the additional current output (4 mA = 0 °C, 20 mA = 100 °C)
- **Digital**: Depending on the electronics version via the HART, Profield PA, Foundation Fieldbus or Modbus signal

### Reference conditions and influencing variables (according to DIN EN 60770-1)

- **Reference conditions according to DIN EN 61298-1**
  - Temperature +15 ... +25 °C (+59 ... +77 °F)
  - Relative humidity 45 ... 75 %
  - Air pressure 860 ... 1060 mbar/86 ... 106 kPa (12.5 ... 15.4 psig)
- **Determination of characteristics** Limit point adjustment according to IEC 61298-2
Characteristic curve: Linear
Reference installation position: upright, diaphragm points downward
Influence of the installation position: < 0.2 mbar/20 Pa (0.003 psig)
Deviation in the current output due to strong, high-frequency electromagnetic fields acc. to EN 61326-1:
< ±150 µA

Deviation (according to IEC 60770)
Applies to the digital signal output (HART, Profibus PA, Foundation Fieldbus) as well as to the analogue current output 4 ... 20 mA and refers to the set span. Turn down (TD) is the ratio "nominal measuring range/set span".
The specified values correspond to the value $F_{\text{TD}}$ in chapter "Calculation of the total deviation".

<table>
<thead>
<tr>
<th>Accuracy class</th>

</table>

Influence of the medium or ambient temperature
Thermal change zero signal and output span through product temperature
Applies to the digital signal output (HART, Profibus PA, Foundation Fieldbus) as well as to the analogue current output 4 ... 20 mA and refers to the set span. Turn down (TD) is the ratio "nominal measuring range/set span".
The thermal change of the zero signal and output span corresponds to the value $F_{\text{T}}$ in chapter "Calculation of the total deviation (according to DIN 16086)".

Piezoresistive/strain gauge measuring cell

![Figure 39: Basic temperature error $F_{\text{T Basis}}$ at TD 1 : 1](image)
The basic temperature error in % from the above graphic can increase due to the additional factors, such as accuracy class (factor FMZ) and Turn Down (factor FTD). The additional factors are listed in the following tables.

**Additional factor through accuracy class**

<table>
<thead>
<tr>
<th>Accuracy class</th>
<th>0.075 %, 0.1 %</th>
<th>0.2 %</th>
</tr>
</thead>
<tbody>
<tr>
<td>Factor FMZ</td>
<td>1</td>
<td>3</td>
</tr>
</tbody>
</table>

**Additional factor through Turn Down**

The additional factor FTD through Turn down is calculated according to the following formula:

\[ F_{TD} = 0.5 \times TD + 0.5 \]

In the table, example values for typical Turn downs are listed.

<table>
<thead>
<tr>
<th>Turn Down</th>
<th>TD 1 : 1</th>
<th>TD 2.5 : 1</th>
<th>TD 5 : 1</th>

**Ceramic/Metal measuring cell - Standard**

![Graph showing the basic temperature error F_{basis} at TD 1 : 1](image)

*Fig. 40: Basic temperature error F_{basis} at TD 1 : 1*

The basic temperature error in % from the above graphic can increase due to the additional factors, depending on the measuring cell version (factor FMZ) and the Turn Down (factor FTD). The additional factors are listed in the following tables.

**Additional factor through measuring cell version**

<table>
<thead>
<tr>
<th>Measuring cell version</th>
<th>Measuring cell - Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.075 %, 0.1 %</td>
<td>0.2 %</td>
</tr>
<tr>
<td>Factor FMZ</td>
<td>1</td>
</tr>
</tbody>
</table>

**Additional factor through Turn Down**

The additional factor FTD through Turn down is calculated according to the following formula:
\[ F_{TD} = 0.5 \times TD + 0.5 \]

In the table, example values for typical Turn downs are listed.

<table>
<thead>
<tr>
<th>Turn Down</th>
<th>TD 1 : 1</th>
<th>TD 2.5 : 1</th>
<th>TD 5 : 1</th>

</thead>
<tbody>
<tr>
<td>Factor FTD</td>
<td>1</td>
<td>1.75</td>
<td>3</td>
<td>5.5</td>
<td>10.5</td>
</tr>
</tbody>
</table>

**Thermal change current output through ambient temperature**

Applies also to the analogue 4 … 20 mA current output and refers to the set span.

Thermal change, current output  
< 0.05 %/10 K, max. < 0.15 %, each with -40 … +80 °C  
(-40 … +176 °F)

**Long-term stability (according to DIN 16086)**

Applies to the respective digital signal output (e.g. HART, Profibus PA) as well as to analogue current output 4 … 20 mA under reference conditions. Specifications refer to the set span. Turn down (TD) is the ratio nominal measuring range/set span.

**Long-term stability zero signal and output span**

Approvals
Instruments with approvals can have deviating technical data (depending on the version). For such instruments, the corresponding approval documents must be noted.

---

10) Galvanic separation between electronics and metal housing parts
11) Protection rating IP 66/IP 68 (0.2 bar) only in conjunction with absolute pressure.
12) When used with fulfilled housing protection.
11.2 Calculation of the total deviation

The total deviation of a pressure transmitter indicates the maximum measurement error to be expected in practice. It is also called maximum practical deviation or operational error.

According to DIN 16086, the total deviation $F_{\text{total}}$ is the sum of the basic accuracy $F_{\text{perf}}$ and the long-term stability $F_{\text{stab}}$:

$$F_{\text{total}} = F_{\text{perf}} + F_{\text{stab}}$$

The basic accuracy $F_{\text{perf}}$ consists of the thermal change of the zero signal and the output span $F_T$ as well as the deviation $F_{KL}$:

$$F_{\text{perf}} = \sqrt{(F_T)^2 + (F_{KL})^2}$$

The thermal change of zero signal and output span $F_T$ is specified in chapter "Technical data". The basic temperature error $F_T$ is shown in a graphic. Depending on the measuring cell version and Turn down, this value must be multiplied with the additional factors FMZ and FTD:

$$F_T \times \text{FMZ} \times \text{FTD}$$

Also these values are specified in chapter "Technical data".

This applies for a digital signal output through HART, Profibus PA or Foundation Fieldbus.

With a 4 … 20 mA output, the thermal change of the current output $F_a$ must be added:

$$F_{\text{perf}} = \sqrt{(F_T)^2 + (F_{KL})^2 + (F_a)^2}$$

To provide a better overview, the formula symbols are listed together below:

- $F_{\text{total}}$: Total deviation
- $F_{\text{perf}}$: Basic accuracy
- $F_{\text{stab}}$: Long-term stability
- $F_T$: Thermal change of zero signal and output span (temperature error)
- $F_{KL}$: Deviation
- $F_a$: Thermal change of the current output
- $\text{FMZ}$: Additional factor measuring cell version
- $\text{FTD}$: Additional factor Turn down

11.3 Calculation of the total deviation - Practical example

Data

Pressure measurement in the pipeline 4 bar (400 KPa)

Product temperature up to 50 °C

CPT-2x with measuring range 10 bar, deviation < 0.2 %, process fitting G1½ (measuring cell ø 28 mm)

1. Calculation of the Turn down

$$\text{TD} = \frac{10 \text{ bar}}{4 \text{ bar}} \Rightarrow \text{TD} = 2.5 : 1$$
2. Determination temperature error $F_T$

![Diagram showing temperature error determination](image)

</table>

*Tab. 25: Determination of the additional factor "turn down" for the above example: $F_{TD} = 1.75$*

$$F_T = F_{TBasis} \times F_{MZ} \times F_{TD}$$

$$F_T = 0.15\% \times 3 \times 1.75$$

$$F_T = 0.79\%$$

3. Determination of deviation and long-term stability

The required values for deviation $F_{Ki}$ and long-term stability $F_{stab}$ are available in the technical data:

<table>
<thead>
<tr>
<th>Accuracy class</th>
<th>Non-linearity, hysteresis and non-repeatability</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>TD ≤ 5 : 1</td>
</tr>
<tr>
<td>0.05 %</td>
<td>&lt; 0.05 %</td>
</tr>
<tr>
<td>0.1 %</td>
<td>&lt; 0.1 %</td>
</tr>
<tr>
<td>0.2 %</td>
<td>&lt; 0.2 %</td>
</tr>
</tbody>
</table>

*Tab. 26: Determination of the deviation from table: $F_{Ki} = 0.2\%$*
The example shows that the measurement error in practice can be considerably higher than the basic accuracy. Reasons are temperature influence and turn down.
11.4 Dimensions

**Plastic housing**

CPT-2x, threaded fitting not front-flush

1. G½ manometer connection (EN 837)
2. G½ A inside G¾ (ISO 228-1)
3. G½ A inside G¾ A PVDF (ISO 228-1)
4. G½ manometer connection (EN 837) volume-reduced
5. ½ NPT inside ¼ NPT
6. M20 x 1.5 manometer connection (EN 837)

Notes:
For the version with "Second Line of Defense", the measure of length increases by 17 mm (0.67 in).
CPT-2x, threaded fitting front-flush

Fig. 53: CPT-2x, threaded fitting front-flush

1. G½ (ISO 228-1)
2. G¾ (DIN 3852-E)
3. G1 A (ISO 228-1)
4. G1½ (DIN 3852-A)
5. G1½ A PVDF (DIN 3852-A-B)
6. 1½ NPT (ASME B1.20.1)

For the version with temperature range up to 150 °C/302 °F, the measure of length increases by 28 mm (1.1 in).

For the version with "Second Line of Defense", the measure of length increases by 17 mm (0.67 in).
**CPT-2x, hygienic fitting**

2. Hygienic connection with compression nut F40
3. DRD
4. Tuchenhagen Varivent DN 32
5. Slotted nut DN 40 according to DIN 11851
6. Slotted nut DN 50 according to DIN 11851
7. Slotted nut DN 50 according to DIN 11864-1

For the version with temperature range up to 150 °C/302 °F, the measure of length increases by 28 mm (1.1 in).

For the version with "Second Line of Defense", the measure of length increases by 17 mm (0.67 in).
CPT-2x, flange connection

Fig. 55: CPT-2x, flange connection

1 Flange connection according to DIN 2501
2 Flange connection according to ASME B16.5

For the version with temperature range up to 150 °C/302 °F, the measure of length increases by 28 mm (1.1 in).

For the version with "Second Line of Defense", the measure of length increases by 17 mm (0.67 in).
