Safety instructions for Ex areas
Take note of the Ex specific safety instructions for Ex applications. These instructions are attached as documents to each instrument with Ex approval and are part of the operating instructions manual.

Editing status: 2018-03-05
1 About this document

1.1 Function
This operating instructions manual provides all the information you need for mounting, connection and setup as well as important instructions for maintenance, fault rectification, the exchange of parts and the safety of the user. Please read this information before putting the instrument into operation and keep this manual accessible in the immediate vicinity of the device.

1.2 Target group
This operating instructions manual is directed to trained personnel. The contents of this manual must be made available to the qualified personnel and implemented.

1.3 Symbols used

- **Information, tip, note**
  This symbol indicates helpful additional information.

- **Caution**: If this warning is ignored, faults or malfunctions can result.

- **Warning**: If this warning is ignored, injury to persons and/or serious damage to the instrument can result.

- **Danger**: If this warning is ignored, serious injury to persons and/or destruction of the instrument can result.

- **Ex applications**
  This symbol indicates special instructions for Ex applications.

- **List**
  The dot set in front indicates a list with no implied sequence.

- **Action**
  This arrow indicates a single action.

- **Sequence of actions**
  Numbers set in front indicate successive steps in a procedure.

- **Battery disposal**
  This symbol indicates special information about the disposal of batteries and accumulators.
2 For your safety

2.1 Authorised personnel
All operations described in this documentation must be carried out only by trained specialist personnel authorised by the plant operator. During work on and with the device the required personal protective equipment must always be worn.

2.2 Appropriate use
The IPT-2x is a pressure transmitter for process pressure and hydrostatic level measurement.
You can find detailed information about the area of application in chapter “Product description”.
Operational reliability is ensured only if the instrument is properly used according to the specifications in the operating instructions manual as well as possible supplementary instructions.

2.3 Warning about incorrect use
Inappropriate or incorrect use of this product can give rise to application-specific hazards, e.g. vessel overfill through incorrect mounting or adjustment. Damage to property and persons or environmental contamination can result. Also, the protective characteristics of the instrument can be impaired.

2.4 General safety instructions
This is a state-of-the-art instrument complying with all prevailing regulations and directives. The instrument must only be operated in a technically flawless and reliable condition. The operator is responsible for the trouble-free operation of the instrument. When measuring aggressive or corrosive media that can cause a dangerous situation if the instrument malfunctions, the operator has to implement suitable measures to make sure the instrument is functioning properly.
During the entire duration of use, the user is obliged to determine the compliance of the necessary occupational safety measures with the current valid rules and regulations and also take note of new regulations.
The safety instructions in this operating instructions manual, the national installation standards as well as the valid safety regulations and accident prevention rules must be observed by the user.
For safety and warranty reasons, any invasive work on the device beyond that described in the operating instructions manual may be carried out only by personnel authorised by the manufacturer. Arbitrary conversions or modifications are explicitly forbidden. For safety reasons, only the accessory specified by the manufacturer must be used.
To avoid any danger, the safety approval markings and safety tips on the device must also be observed and their meaning read in this operating instructions manual.

2.5  EU conformity

The device fulfils the legal requirements of the applicable EU directives. By affixing the CE marking, we confirm the conformity of the instrument with these directives.

Electromagnetic compatibility

Instruments with plastic housing are designed for use in an industrial environment. Nevertheless, electromagnetic interference from electrical conductors and radiated emissions must be taken into account, as is usual with class A instruments according to EN 61326-1. If the instrument is used in a different environment, the electromagnetic compatibility to other instruments must be ensured by suitable measures.

2.6  Permissible process pressure

For safety reasons, the instrument must only be operated within the permissible process conditions. You can find detailed information on the process conditions in chapter "Technical data" as well as on the type label.

The permissible process pressure range is specified on the type label with "Process pressure", see chapter "Configuration". This applies even if a measuring cell with a measuring range (order-related) higher than the permissible pressure range of the process fitting is installed.

A temperature derating, e.g. with flanges, can limit the permissible process pressure range.

2.7  NAMUR recommendations

NAMUR is the automation technology user association in the process industry in Germany. The published NAMUR recommendations are accepted as the standard in field instrumentation.

The device fulfils the requirements of the following NAMUR recommendations:

- NE 21 – Electromagnetic compatibility of equipment
- NE 53 – Compatibility of field devices and display/adjustment components
- NE 107 – Self-monitoring and diagnosis of field devices

For further information see www.namur.de.

2.8  Installation and operation in the USA and Canada

This information is only valid for USA and Canada. Hence the following text is only available in the English language.

Installations in the US shall comply with the relevant requirements of the National Electrical Code (ANSI/NFPA 70).

Installations in Canada shall comply with the relevant requirements of the Canadian Electrical Code

1) Not fulfilled when connecting to an external display and adjustment unit.
3 Product description

3.1 Configuration

The type label contains the most important data for identification and use of the instrument:

Fig. 1: Layout of the type label (example)

1 Instrument type
2 Field for approvals
3 Signal output and voltage supply
4 Protection rating
5 Measuring range
6 Permissible process conditions
7 Material wetted parts
8 Product code
9 Order number
10 Serial number of the instrument
11 Symbol of the device protection class
12 ID numbers, instrument documentation
13 Reminder to observe the instrument documentation

Scope of this operating instructions manual
This operating instructions manual applies to the following instrument versions:
- Hardware from 1.0.0
- Software version from 1.2.0

Note:
You can find the hardware and software version of the instrument as follows:
- On the type plate of the electronics module
- In the adjustment menu under "Info"

Scope of delivery
The scope of delivery encompasses:
- Instrument IPT-2x
- Documentation
  - Operating instructions IPT-2x
  - Characteristics test certificate
  - Instructions for optional instrument features
  - Ex-specific "Safety instructions" (with Ex versions)
If necessary, further certificates

Note:
Optional instrument features are also described in this operating instructions manual. The respective scope of delivery results from the order specification.

3.2 Principle of operation

Measured variables
The IPT-2x is suitable for the measurement of the following process variables:
- Process pressure
- Level

![Fig. 2: Process pressure measurement IPT-2x](image)

Application area
IPT-2x is suitable for applications in virtually all industries. It is used for the measurement of the following pressure types.
- Gauge pressure
- Absolute pressure
- Vacuum

Measured products
Measured products are gases, vapours and liquids. IPT-2x is especially suitable for applications with higher temperatures and high pressures.

Measuring system
The process pressure acts on the sensor element via the process diaphragm. The process pressure causes a resistance change which is converted into a corresponding output signal and outputted as measured value.

Piezoresistive sensor element
Measuring ranges up to 40 bar: piezoresistive sensor element with internal transmission liquid is used.
3 Product description

Fig. 3: Configuration of the measuring system with piezoresistive sensor element
1 Sensor element
2 Base element
3 Transmission liquid
4 Process diaphragm

Strain gauge (DMS) sensor element
For measuring ranges above 100 bar, a strain gauge (DMS) sensor element (dry system) is used.

Fig. 4: Configuration of the measuring system with strain gauge (DMS) sensor element
1 Sensor element
2 Process diaphragm
3 Pressure cylinder

Ceramic/metallic measuring cell
With small measuring ranges \( \leq 400 \) mbar or higher temperature ranges, the ceramic/metallic measuring cell is the measuring unit. It consists of the ceramic-capacitive measuring cell and a special, temperature-compensated chemical seal system.
3 Product description

Fig. 5: Configuration of the ceramic/metallic measuring cell

1  Process diaphragm
2  Isolating liquid
3  FeNi adapter
4  Ceramic-capacitive measuring cell

Pressure types
The measuring cell design depends on the selected pressure type.

Relative pressure: the measuring cell is open to the atmosphere. The ambient pressure is detected in the measuring cell and compensated. It thus has no influence on the measured value.

Absolute pressure: the measuring cell is evacuated and encapsulated. The ambient pressure is not compensated and does hence influence the measured value.

Seal concept
The measuring system is completely welded and hence sealed against the process. The sealing of the process fitting against the process is carried out by a seal provided on site.

3.3 Packaging, transport and storage

Packaging
Your instrument was protected by packaging during transport. Its capacity to handle normal loads during transport is assured by a test based on ISO 4180.

The packaging of standard instruments consists of environment-friendly, recyclable cardboard. For special versions, PE foam or PE foil is also used. Dispose of the packaging material via specialised recycling companies.

Transport
Transport must be carried out in due consideration of the notes on the transport packaging. Nonobservance of these instructions can cause damage to the device.

Transport inspection
The delivery must be checked for completeness and possible transit damage immediately at receipt. Ascertained transit damage or concealed defects must be appropriately dealt with.
3 Product description

Storage

Up to the time of installation, the packages must be left closed and stored according to the orientation and storage markings on the outside.

Unless otherwise indicated, the packages must be stored only under the following conditions:

- Not in the open
- Dry and dust free
- Not exposed to corrosive media
- Protected against solar radiation
- Avoiding mechanical shock and vibration

Storage and transport temperature

- Storage and transport temperature see chapter "Supplement - Technical data - Ambient conditions"
- Relative humidity 20 ... 85 %

Lifting and carrying

With instrument weights of more than 18 kg (39.68 lbs) suitable and approved equipment must be used for lifting and carrying.
4 Mounting

4.1 General instructions

Make sure before mounting that all parts of the instrument exposed to the process are suitable for the existing process conditions.

These are mainly:

- Active measuring component
- Process fitting
- Process seal

Process conditions in particular are:

- Process pressure
- Process temperature
- Chemical properties of the medium
- Abrasion and mechanical influences

You can find detailed information on the process conditions in chapter "Technical data" as well as on the type label.

Suitability for the ambient conditions

The instrument is suitable for standard and extended ambient conditions acc. to IEC/EN 61010-1.

Protection against moisture

Protect your instrument against moisture ingress through the following measures:

- Use a suitable connection cable (see chapter "Connecting to power supply")
- Tighten the cable gland or plug connector
- When mounting horizontally, turn the housing so that the cable gland or plug connector point downward
- Lead the connection cable downward in front of the cable entry or plug connector

This applies mainly to outdoor installations, in areas where high humidity is expected (e.g. through cleaning processes) and on cooled or heated vessels.

To maintain the housing protection, make sure that the housing lid is closed during operation and locked, if necessary.

Make sure that the degree of contamination specified in chapter "Technical data" meets the existing ambient conditions.

Screwing in

On instruments with threaded fitting, the hexagon must be tightened with a suitable wrench. For the proper wrench size see chapter "Dimensions".

Warning:

The housing must not be used to screw the instrument in! Applying tightening force can damage internal parts of the housing.

Vibrations

If there is strong vibration at the mounting location, the instrument version with external housing should be used. See chapter "External housing".
**Process pressure range - Mounting accessory**

The permissible process pressure range is stated on the type label. The instrument should only be operated with these pressures if the mounting accessory used also fulfills these values. This should be ensured by suitable flanges, welded sockets, tension rings with Clamp connections, sealings, etc.

**Temperature limits**

Higher process temperatures often mean also higher ambient temperatures. Make sure that the upper temperature limits stated in chapter "Technical data" for the environment of the electronics housing and connection cable are not exceeded.

---

**Fig. 6: Temperature ranges**

1. Process temperature
2. Ambient temperature

---

**4.2 Ventilation and pressure compensation**

The filter element in the electronics housing has the following functions:

- Ventilation of the electronics housing
- Atmospheric pressure compensation (with relative pressure measuring ranges)

**Caution:**

The filter element causes a time-delayed pressure compensation. When quickly opening/closing the housing cover, the measured value can change for approx. 5 s by up to 15 mbar.

For an effective ventilation, the filter element must be always free from buildup. In case of horizontal mounting, turn the housing so that the filter element points downward after the instrument is installed. This provides better protection against buildup.

**Caution:**

Do not use a high-pressure cleaner. The filter element could be damaged, which would allow moisture into the housing.

The following paragraphs describe how the filter element is arranged in the different instrument versions.
Filter element - Position

Fig. 7: Position of the filter element
1 Plastic, stainless steel single chamber (precision casting)
2 Aluminium - single chamber
3 Stainless steel single chamber (electropolished)
4 Plastic double chamber
5 Aluminium - double chamber
6 Filter element

With the following instruments a blind plug is installed instead of the filter element:
- Instruments in protection IP 66/IP 68 (1 bar) - ventilation via capillaries in non-detachable cable
- Instruments with absolute pressure

Filter element - Position
Ex-d version

→ Turn the metal ring in such a way that the filter element points downward after installation of the instrument. This provides better protection against buildup.

Fig. 8: Position of the filter element - Ex-d version
1 Rotatable metal ring
2 Filter element

Instruments with absolute pressure have a blind plug mounted instead of the filter element.
Filter element - Position
Second Line of Defense

The Second Line of Defense (SLOD) is a second level of the process separation in form of a gas-tight leadthrough in the housing neck, preventing products from penetrating into the housing.

With these instruments, the process assembly is completely encapsulated. An absolute pressure measuring cell is used so that no ventilation is required.

With relative pressure measuring ranges, the ambient pressure is detected and compensated by a reference sensor in the electronics.

Fig. 9: Position of the filter element - gastight leadthrough
1 Filter element
2 Gas-tight leadthrough

Filter element - Position
IP 69K version

Instruments with absolute pressure have a blind plug mounted instead of the filter element.

Measurement setup in gases

4.3 Process pressure measurement

Keep the following in mind when setting up the measuring system:

- Mount the instrument above the measuring point

Possible condensation can then drain off into the process line.
Keep the following in mind when setting up the measuring system:

- Connect via a siphon
- Do not insulate the siphon
- Fill the siphon with water before setup

A protective accumulation of water is formed through condensation in the pipe bends. Even in applications with hot steam, a medium temperature $< 100 \, ^\circ\text{C}$ on the transmitter is ensured.
4 Mounting

Measurement setup in liquids

Keep the following in mind when setting up the measuring system:

- Mount the instrument below the measuring point

The effective pressure line is always filled with liquid and gas bubbles can bubble up to the process line.

![Diagram of measurement setup for process pressure measurement of liquids in pipelines](image)

Fig. 13: Measurement setup for process pressure measurement of liquids in pipelines

1. IPT-2x
2. Blocking valve
3. Pipeline

4.4 Level measurement

Keep the following in mind when setting up the measuring system:

- Mount the instrument below the min. level
- Do not mount the instrument close to the filling stream or emptying area
- Mount the instrument so that it is protected against pressure shocks from the stirrer

![Diagram of measurement setup for level measurement](image)

Fig. 14: Measurement setup for level measurement
4.5 External housing

**Configuration**

Fig. 15: Configuration, process module, external housing

1. Pipeline
2. Process module
3. Connection cable process assembly - External housing
4. External housing
5. Signal cable

**Mounting**

1. Mark the holes according to the following drilling template
2. Fasten wall mounting plate with 4 screws

Fig. 16: Drilling template - wall mounting plate
5 Connecting to the bus system

5.1 Preparing the connection

Safety instructions
Always keep in mind the following safety instructions:

- Carry out electrical connection by trained personnel authorised by the plant operator
- If overvoltage surges are expected, overvoltage arresters should be installed

**Warning:**
Connect only in the complete absence of line voltage.

Voltage supply
The instrument requires a operating voltage of 9 ... 32 V DC. Operating voltage and the digital bus signal are carried on the same two-wire connection cable. Power is supplied via the H1 power supply.

Connection cable
Connection is carried out with screened cable according to Fieldbus specification.
Use cable with round cross section for instruments with housing and cable gland. To ensure the seal effect of the cable gland (IP protection rating), find out which cable outer diameter the cable gland is suitable for.
Make sure that the cable used has the required temperature resistance and fire safety for max. occurring ambient temperature
Use a cable gland fitting the cable diameter.
Make sure that the entire installation is carried out according to the Fieldbus specification. In particular, make sure that the bus is terminated with suitable terminating resistors.

Cable glands
**Metric threads**
In the case of instrument housings with metric thread, the cable glands are screwed in at the factory. They are sealed with plastic plugs as transport protection.
You have to remove these plugs before electrical connection.

**NPT thread**
In the case of instrument housings with self-sealing NPT threads, it is not possible to have the cable entries screwed in at the factory. The free openings for the cable glands are therefore covered with red dust protection caps as transport protection.
Prior to setup you have to replace these protective caps with approved cable glands or close the openings with suitable blind plugs.
On plastic housings, the NPT cable gland or the Conduit steel tube must be screwed into the threaded insert without grease.
Max. torque for all housings, see chapter "Technical data".

Cable screening and grounding
Make sure that the cable screen and grounding are carried out according to Fieldbus specification. We recommend to connect the cable screen to ground potential on both ends.
In systems with potential equalisation, connect the cable screen directly to ground potential at the power supply unit, in the connection box and at the sensor. The screen in the sensor must be connected directly to the internal ground terminal. The ground terminal outside on the housing must be connected to the potential equalisation (low impedance).

### 5.2 Connecting

The voltage supply and signal output are connected via the spring-loaded terminals in the housing.

Connection to the display and adjustment module or to the interface adapter is carried out via contact pins in the housing.

**Information:**
The terminal block is pluggable and can be removed from the electronics. To do this, lift the terminal block with a small screwdriver and pull it out. When reinserting the terminal block, you should hear it snap in.

**Connection procedure**

Proceed as follows:

1. Unscrew the housing lid
2. If a display and adjustment module is installed, remove it by turning it slightly to the left
3. Loosen compression nut of the cable gland and remove blind plug
4. Remove approx. 10 cm (4 in) of the cable mantle, strip approx. 1 cm (0.4 in) of insulation from the ends of the individual wires
5. Insert the cable into the sensor through the cable entry

---

![Fig. 17: Connection steps 5 and 6](image)

1. Single chamber housing
2. Double chamber housing

6. Insert the wire ends into the terminals according to the wiring plan

**Information:**
Solid cores as well as flexible cores with wire end sleeves are inserted directly into the terminal openings. In case of flexible cores without end sleeves, press the terminal from above with a small screwdriver, the terminal opening is then free. When the screwdriver is released, the terminal closes again.
You can find further information on the max. wire cross-section under "Technical data - Electromechanical data".

7. Check the hold of the wires in the terminals by lightly pulling on them
8. Connect the screen to the internal ground terminal, connect the external ground terminal to potential equalisation
9. Tighten the compression nut of the cable entry gland. The seal ring must completely encircle the cable
10. Reinsert the display and adjustment module, if one was installed
11. Screw the housing lid back on
The electrical connection is finished.

5.3 Single chamber housing

Ex

The following illustration applies to the non-Ex, Ex-ia and Ex-d version.

Electronics and terminal compartment

Fig. 18: Electronics and terminal compartment - single chamber housing
1 Voltage supply, signal output
2 Contact pins for the display and adjustment module or interface adapter
3 Simulation switch ("1" = mode for simulation release)
4 For external display and adjustment unit
5 Ground terminal for connection of the cable screen

5.4 Double chamber housing

Ex

The following illustrations apply to the non-Ex as well as to the Ex-ia version.
5 Connecting to the bus system

**Electronics compartment**

![Fig. 19: Electronics compartment - double chamber housing](image)

1. Internal connection to the terminal compartment

Electronics and terminal compartment

![Diagram of electronics and terminal compartment]

**Fig. 25: Electronics and terminal compartment - single chamber housing**

1. Voltage supply, signal output
2. Contact pins for the display and adjustment module or interface adapter
3. Simulation switch ("1" = mode for simulation release)
4. For external display and adjustment unit
5. Ground terminal for connection of the cable screen

5.7 Switch-on phase

After connecting the instrument to power supply or after a voltage recurrence, the instrument carries out a self-check for approx. 5 s:

- Internal check of the electronics
- Indication of a status message on the display or PC
• Output signal at instruments with current output jumps to the set fault current

Then the actual measured value is outputted to the signal cable. The value takes into account settings that have already been carried out, e.g. default setting.
6 Set up with the display and adjustment module

6.1 Insert display and adjustment module

The display and adjustment module can be inserted into the sensor and removed again at any time. You can choose any one of four different positions - each displaced by 90°. It is not necessary to interrupt the power supply.

Proceed as follows:
1. Unscrew the housing lid
2. Place the display and adjustment module on the electronics in the desired position and turn it to the right until it snaps in.
3. Screw housing lid with inspection window tightly back on

Disassembly is carried out in reverse order.

The display and adjustment module is powered by the sensor, an additional connection is not necessary.

Fig. 26: Installing the display and adjustment module in the electronics compartment of the single chamber housing
6 Set up with the display and adjustment module

Fig. 27: Installing the display and adjustment module in the double chamber housing
1 In the electronics compartment
2 In the terminal compartment

Note:
If you intend to retrofit the instrument with a display and adjustment module for continuous measured value indication, a higher lid with an inspection glass is required.

6.2 Adjustment system

Fig. 28: Display and adjustment elements
1 LC display
2 Adjustment keys

Key functions

- **[OK] key:**
  - Move to the menu overview
  - Confirm selected menu
  - Edit parameter
  - Save value

- **[->] key:**
  - Change measured value presentation
  - Select list entry
  - Select menu items in the quick setup menu
6 Set up with the display and adjustment module

- Select editing position
  - \([+]\) key:
    - Change value of the parameter
  - \([ESC]\) key:
    - Interrupt input
    - Jump to next higher menu

**Adjustment system**

The instrument is operated via the four keys of the display and adjustment module. The individual menu items are shown on the LC display. You can find the function of the individual keys in the previous illustration.

**Time functions**

When the \([+]\) and \([-]\) keys are pressed quickly, the edited value, or the cursor, changes one value or position at a time. If the key is pressed longer than 1 s, the value or position changes continuously.

When the \([OK]\) and \([ESC]\) keys are pressed simultaneously for more than 5 s, the display returns to the main menu. The menu language is then switched over to "English".

Approx. 60 minutes after the last pressing of a key, an automatic reset to measured value indication is triggered. Any values not confirmed with \([OK]\) will not be saved.

**6.3 Measured value indication**

With the \([-]\) key you can move between three different indication modes.

In the first view, the selected measured value is displayed in large digits.

In the second view, the selected measured value and a corresponding bar graph presentation are displayed.

In the third view, the selected measured value as well as a second selectable value, e.g. the temperature, are displayed.

With the "OK" key you move (during the initial setup of the instrument) to the selection menu "Language".

**Selection language**

In this menu item, you can select the national language for further parameterization.

With the "[-]" button, you can select the requested language, with "OK" you confirm the selection and move to the main menu.
6 Set up with the display and adjustment module

You can change your selection afterwards with the menu item "Setup - Display, Menu language".

6.4 Parameter adjustment - Quick setup
To quickly and easily adapt the sensor to the application, select the menu item "Quick setup" in the start graphic on the display and adjustment module.

Select the individual steps with the [->] key.
After the last step, "Quick setup terminated successfully" is displayed briefly.
The return to the measured value indication is carried out through the [->] or [ESC] keys or automatically after 3 s

Note:
You can find a description of the individual steps in the quick setup guide of the sensor.
You can find "Extended adjustment" in the next sub-chapter.

6.5 Parameter adjustment - Extended adjustment
For technically demanding measuring points, you can carry out extended settings in "Extended adjustment".

The main menu is divided into five sections with the following functions:

Setup: Settings, e.g., for measurement loop name, application, units, position correction, adjustment, signal output
Display: Settings, e.g., for language, measured value display, lighting
Diagnostics: Information, e.g. on instrument status, pointer, measurement reliability, simulation
Additional adjustments: PIN, date/time, reset, copy function
Info: Instrument name, hardware and software version, date of manufacture, device ID, sensor features
6 Set up with the display and adjustment module

Note:
For optimum adjustment of the measuring point, the individual submenu items in the main menu item "Setup" should be selected one after the other and provided with the correct parameters. If possible, go through the items in the given sequence.

The procedure is described below.

The following submenu points are available:

<table>
<thead>
<tr>
<th>Inbetriebnahme</th>
<th>Inbetriebnahme</th>
</tr>
</thead>
<tbody>
<tr>
<td>Einheiten</td>
<td>Abgleich</td>
</tr>
<tr>
<td>Lagekorrektur</td>
<td>Linearisierung</td>
</tr>
<tr>
<td>Abgleich</td>
<td>Bediener sperren</td>
</tr>
<tr>
<td>Dämpfung</td>
<td></td>
</tr>
</tbody>
</table>

The submenu points are described below.

Setup - Application
In this menu item you activate/deactivate the slave sensor for electronic differential pressure and select the application.
IPT-2x can be used for process pressure and level measurement. Default setting is process pressure measurement. The mode can be changed in this adjustment menu.

If you have connected no slave sensor, you confirm this with "Deactivate".

Depending on the selected application, different subchapters in the following adjustment steps are important. There you can find the individual adjustment steps.

<table>
<thead>
<tr>
<th>Inbetriebnahme</th>
<th>Slave for electronic differential pressure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Einheiten</td>
<td>Disabled!</td>
</tr>
<tr>
<td>Lagekorrektur</td>
<td>Application</td>
</tr>
<tr>
<td>Abgleich</td>
<td>Pressure</td>
</tr>
<tr>
<td>Dämpfung</td>
<td></td>
</tr>
</tbody>
</table>

Enter the requested parameters via the appropriate keys, save your settings with [OK] and jump to the next menu item with the [ESC] and the [->] key.

Setup - Units
In this menu item, the adjustment units of the instrument are determined. The selection determines the unit displayed in the menu items "Min. adjustment (Zero)" and "Max. adjustment (Span)".

Unit of measurement:

<table>
<thead>
<tr>
<th>Units of measurement</th>
<th>Units of measurement</th>
<th>Units of measurement</th>
</tr>
</thead>
<tbody>
<tr>
<td>m</td>
<td>nbar</td>
<td>psi</td>
</tr>
<tr>
<td>°C</td>
<td>°C</td>
<td>°C</td>
</tr>
</tbody>
</table>

If the level should be adjusted in a height unit, the density of the medium must also be entered later during the adjustment.

In addition, the temperature unit of the instrument is specified. The selection determines the unit displayed in menu items "Peak value, temperature" and "in the variables of the digital output signal".
Temperature unit:
Enter the requested parameters via the appropriate keys, save your settings with [OK] and jump to the next menu item with the [ESC] and the [->] key.

Setup - Position correction
Especially with chemical seal systems, the installation position of the instrument can shift (offset) the measured value. Position correction compensates this offset. In the process, the actual measured value is taken over automatically. With relative pressure measuring cells a manual offset can also be carried out.

If the actual measured value should be taken over as correction value during automatic position correction, this value must not be influenced by product coverage or static pressure.

With the manual position correction, the offset value can be determined by the user. Select for this purpose the function "Edit" and enter the requested value.

Save your settings with [OK] and move with [ESC] and [->] to the next menu item.

After the position correction is carried out, the actual measured value is corrected to 0. The corrective value appears with an inverse sign as offset value in the display.

The position correction can be repeated as often as necessary. However, if the sum of the corrective values exceeds 20 % of the nominal measuring range, then no position correction is possible.

Setup - Adjustment
IPT-2x always measures pressure independently of the process variable selected in the menu item "Application". To output the selected process variable correctly, an allocation of the output signal to 0 % and 100 % must be carried out (adjustment).

With the application "Level", the hydrostatic pressure, e.g. with full and empty vessel, is entered for adjustment. See following example:
6 Set up with the display and adjustment module

![Diagram of parameter adjustment example](image)

**Fig. 29: Parameter adjustment example "Min./max. adjustment, level measurement"**

1. **Min. level** = 0 % corresponds to 0.0 mbar
2. **Max. level** = 100 % corresponds to 490.5 mbar

If these values are not known, an adjustment with filling levels of e.g. 10 % and 90 % is also possible. By means of these settings, the real filling height is then calculated.

The actual product level during this adjustment is not important, because the min./max. adjustment is always carried out without changing the product level. These settings can be made ahead of time without the instrument having to be installed.

**Note:**

If the adjustment ranges are exceeded, the entered value will not be accepted. Editing can be interrupted with [ESC] or corrected to a value within the adjustment ranges.

For the other process variables such as e.g. process pressure, differential pressure or flow, the adjustment is performed in like manner.

### Setup - Zero adjustment

**Proceed as follows:**

1. Select the menu item "Setup" with [->] and confirm with [OK].
   
   Now select with [->] the menu item "Zero adjustment" and confirm with [OK].

2. Edit the mbar value with [OK] and set the cursor to the requested position with [->].

3. Set the requested mbar value with [+ ] and store with [OK].
4. Go with [ESC] and [->] to the span adjustment
   The zero adjustment is finished.

   **Information:**
   The Zero adjustment shifts the value of the span adjustment. The span, i.e. the difference between these values, however, remains unchanged.

   For an adjustment with pressure, simply enter the actual measured value indicated at the bottom of the display.

   If the adjustment ranges are exceeded, the message "Outside parameter limits" appears. The editing procedure can be aborted with [ESC] or the displayed limit value can be accepted with [OK].

   **Setup - Span adjustment**
   Proceed as follows:
   1. Select with [->] the menu item Span adjustment and confirm with [OK].
   2. Edit the mbar value with [OK] and set the cursor to the requested position with [->].
   3. Set the requested mbar value with [+] and store with [OK].
      For an adjustment with pressure, simply enter the actual measured value indicated at the bottom of the display.
      If the adjustment ranges are exceeded, the message "Outside parameter limits" appears. The editing procedure can be aborted with [ESC] or the displayed limit value can be accepted with [OK].
      The span adjustment is finished.

   **Setup - Min. adjustment Level**
   Proceed as follows:
   1. Select the menu item "Setup" with [->] and confirm with [OK].
      Now select with [->] the menu item "Adjustment", then "Min. adjustment" and confirm with [OK].
   2. Edit the percentage value with [OK] and set the cursor to the requested position with [->].
   3. Set the requested percentage value (e.g. 10 %) with [+] and save with [OK]. The cursor jumps now to the pressure value.
   4. Enter the pressure value corresponding to the min. level (e.g. 0 mbar).
5. Save settings with [OK] and move with [ESC] and [->] to the max. adjustment.

The min. adjustment is finished.

For an adjustment with filling, simply enter the actual measured value indicated at the bottom of the display.

Setup - Max. adjustment Level

Proceed as follows:
1. Select with [->] the menu item Max. adjustment and confirm with [OK].

2. Edit the percentage value with [OK] and set the cursor to the requested position with [->].

3. Set the requested percentage value (e.g. 90 %) with [+] and save with [OK]. The cursor jumps now to the pressure value.

4. Enter the pressure value for the full vessel (e.g. 900 mbar) corresponding to the percentage value.

5. Save settings with [OK]

The max. adjustment is finished.

For an adjustment with filling, simply enter the actual measured value indicated at the bottom of the display.

Setup - Damping

To damp process-dependent measured value fluctuations, set an integration time of 0 … 999 s in this menu item. The increment is 0.1 s.

The default setting depends on the sensor type.

Setup - Linearisation

A linearization is necessary for all vessels in which the vessel volume does not increase linearly with the level - e.g. a horizontal cylindrical or spherical tank - and the indication or output of the volume is required. Corresponding linearization curves are preprogrammed for these vessels. They represent the correlation between the level percentage and vessel volume. The linearization applies to the measured value indication and the current output.

Lock/unlock setup - Adjustment

In the menu item "Lock/unlock adjustment" you safeguard the sensor parameters against unauthorized or unintentional modifications.
6 Set up with the display and adjustment module

With active PIN, only the following adjustment functions are possible without entering a PIN:
- Select menu items and show data
- Read data from the sensor into the display and adjustment module

Releasing the sensor adjustment is also possible in any menu item by entering the PIN.

**Caution:**
With active PIN, adjustment via PACTware/DTM and other systems is also blocked.

**Display - Language**
This menu item enables the setting of the requested national language.

The following languages are available:
- German
- English
- French
- Spanish
- Russian
- Italian
- Dutch
- Portuguese
- Japanese
- Chinese
- Polish
- Czech
- Turkish

In delivery status, the IPT-2x is set to English.

**Display - Displayed value 1 and 2**
In this menu item, you define which measured value is displayed.

The default setting for the display value is "Lin. percent".

**Display - Display format 1 and 2**
In this menu item you define the number of decimal positions with which the measured value is displayed.
6 Set up with the display and adjustment module

The default setting for the display format is "Automatic".

**Display - Backlight**

The display and adjustment module has a backlight for the display. In this menu item you can switch on the lighting. You can find the required operating voltage in chapter "Technical data".

In delivery status, the lighting is switched on.

**Diagnostics - Device status**

In this menu item, the device status is displayed.

In case of error, e.g. the error code F017, e.g. the error description "Adjustment span too small" and a four digit figure are displayed for service purposes. You can find the error codes with description, reason as well as rectification in chapter "Asset Management".

**Diagnostics - Peak values, pressure**

The respective min. and max. measured values are saved in the sensor. The two values are displayed in menu item "Peak values, pressure".

In another window you can carry out a reset of the peak values separately.

**Diagnostics - Peak values, temperature**

The respective min. and max. measured values of the measuring cell and the electronics temperature are stored in the sensor. In menu item "Peak value, temperature", both values are displayed.

In another window you can carry out a reset of the two peak values separately.

**Diagnosis - Simulation**

In this menu item you simulate measured values. Hence, the signal path can be tested via the bus system to the input card of the control system.
Select the requested simulation variable and set the requested value.

To deactivate the simulation, you have to push the [ESC] key and confirm the message "Deactivate simulation" with the [OK] key.

**Caution:**
During simulation, the simulated value is outputted as digital signal.
The status message along with the Asset Management function is "Maintenance".

**Information:**
The sensor terminates the simulation automatically after 60 minutes.

### Additional settings - Date/Time
In this menu item, you adjust the internal clock of the sensor. There is no adjustment for summer/winter (daylight saving) time.

<table>
<thead>
<tr>
<th>Additional adjustments</th>
<th>Date/Time</th>
<th>Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date/Time</td>

</tr>
<tr>
<td>Change now?</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Additional settings - Reset
After a reset, certain parameter adjustments made by the user are reset.

The following reset functions are available:

**Delivery status:** Restores the parameter settings at the time of shipment from the factory, incl. the order-specific settings. Any user-defined linearisation curve as well as the measured value memory are deleted.

**Basic settings:** Resets the parameter settings, incl. special parameters, to the default values of the respective instrument. Any programmed linearisation curve as well as the measured value memory are deleted.

The following table shows the default values of the instrument. Depending on the instrument version or application, all menu items may not be available or some may be differently assigned:
## 6 Set up with the display and adjustment module

### Additional settings - Copy instrument settings

The instrument settings are copied with this function. The following functions are available:

- Read from sensor: Read data from sensor and save in the display and adjustment module
- Write to sensor: Save data from the display and adjustment module back into the sensor

The following data or settings for adjustment of the display and adjustment module are saved:

- All data of the menu "Setup" and "Display"
- In the menu "Additional adjustments" the items "Reset, Date/Time"
- The user-programmable linearization curve

The copied data are permanently saved in an EEPROM memory in the display and adjustment module and remain there even in case of power failure. From there, they can be written into one or more sensors or kept as backup for a possible electronics exchange.

**Note:**

Before the data are saved in the sensor, a safety check is carried out to determine if the data match the sensor. In the process the sensor type of the source data as well as the target sensor are displayed. If the data do not match, a fault message is outputted or the function is blocked. The data are saved only after release.

### Additional settings - Special parameters

In this menu item you gain access to the protected area where you can enter special parameters. In exceptional cases, individual parameters can be modified in order to adapt the sensor to special requirements.

Change the settings of the special parameters only after having contacted our service staff.

### Info - Instrument name

In this menu item, you can read out the instrument name and the instrument serial number:
6 Set up with the display and adjustment module

Info - Instrument version
In this menu item, the hardware and software version of the sensor is displayed.

Info - Factory calibration date
In this menu item, the date of factory calibration of the sensor as well as the date of the last change of sensor parameters are displayed via the display and adjustment module or via the PC.

Info - Device ID
In this menu item, the identification number of the instrument in a Foundation Fieldbus system is shown.

Info - Sensor characteristics
In this menu item, the features of the sensor such as approval, process fitting, seal, measuring range, electronics, housing and others are displayed.

6.6 Saving the parameterisation data

On paper
We recommended writing down the adjustment data, e.g. in this operating instructions manual, and archiving them afterwards. They are thus available for multiple use or service purposes.

In the display and adjustment module
If the instrument is equipped with a display and adjustment module, the parameter adjustment data can be saved therein. The procedure is described in menu item "Copy device settings".
7 Setup with PACTware

7.1 Parameter adjustment
The further setup steps with detailed descriptions can be found in the online help of PACTware and the DTMs.

Note:
Keep in mind that for the setup of model IPT-2x, the current version of the DTM-Collection must be used.

The latest DTM Collection and PACTware version can be downloaded free of charge via the Internet.

7.2 Saving the parameterisation data
We recommend documenting or saving the parameterisation data via PACTware. That way the data are available for multiple use or service purposes.
8 Diagnosis, asset management and service

### 8.1 Maintenance

If the device is used properly, no special maintenance is required in normal operation.

#### Precaution measures against buildup

In some applications, product buildup on the diaphragm can influence the measuring result. Depending on the sensor and application, take precautions to ensure that heavy buildup, and especially a hardening thereof, is avoided.

#### Cleaning

The cleaning helps that the type label and markings on the instrument are visible.

Take note of the following:

- Use only cleaning agents which do not corrode the housings, type label and seals
- Use only cleaning methods corresponding to the housing protection rating

### 8.2 Diagnosis memory

The instrument has several memories available for diagnostic purposes. The data remain there even in case of voltage interruption.

#### Measured value memory

Up to 100,000 measured values can be stored in the sensor in a ring memory. Each entry contains date/time as well as the respective measured value.

Depending on the instrument version, values that can be stored are for example:

- Level
- Process pressure
- Differential pressure
- Static pressure
- Percentage value
- Scaled values
- Current output
- Lin. percent
- Measuring cell temperature
- Electronics temperature

When the instrument is shipped, the measured value memory is active and stores pressure value and measuring cell temperature every 10 s, with electronic differential pressure also the static pressure.

The requested values and recording conditions are set via a PC with PACTware/DTM or the control system with EDD. Data are thus read out and also reset.

#### Event memory

Up to 500 events are automatically stored with a time stamp in the sensor (non-deletable). Each entry contains date/time, event type, event description and value. Event types are for example:

- Modification of a parameter
• Switch-on and switch-off times
• Status messages (according to NE 107)
• Error messages (according to NE 107)

The data are read out via a PC with PACTware/DTM or the control system with EDD.

8.3 Asset Management function

The instrument features self-monitoring and diagnostics according to NE 107 and VDI/VDE 2650. In addition to the status messages in the following tables, detailed error messages are available under menu item "Diagnostics" via the display and adjustment module, PACTware/DTM and EDD.

Status messages

The status messages are divided into the following categories:

• Failure
• Function check
• Out of specification
• Maintenance requirement

and explained by pictographs:

![Pictographs of the status messages](image)

1. Failure - red
2. Out of specification - yellow
3. Function check - orange
4. Maintenance - blue

Failure: Due to a malfunction in the instrument, a fault message is outputted.

This status message is always active. It cannot be deactivated by the user.

Function check: The instrument is being worked on, the measured value is temporarily invalid (for example during simulation).

This status message is inactive by default. It can be activated by the user via PACTware/DTM or EDD.

Out of specification: The measured value is unreliable because an instrument specification was exceeded (e.g. electronics temperature).

This status message is inactive by default. It can be activated by the user via PACTware/DTM or EDD.

Maintenance: Due to external influences, the instrument function is limited. The measurement is affected, but the measured value is still valid. Plan in maintenance for the instrument because a failure is expected in the near future (e.g. due to buildup).

This status message is inactive by default. It can be activated by the user via PACTware/DTM or EDD.
## Failure

Tab. 8: Error codes and text messages, information on causes as well as corrective measures

### 8.4 Rectify faults

The operator of the system is responsible for taking suitable measures to rectify faults.

**Procedure for fault rectification**

The first measures are:
- Evaluation of fault messages via the adjustment device
- Checking the output signal
- Treatment of measurement errors

Further comprehensive diagnostics options are available with a PC with PACTware and the suitable DTM. In many cases, the reasons can be determined in this way and faults rectified.

**Reaction after fault rectification**

Depending on the reason for the fault and the measures taken, the steps described in chapter "Setup" must be carried out again or must be checked for plausibility and completeness.

### 8.5 Exchange process module on version IP 68 (25 bar)

On version IP 68 (25 bar), the user can exchange the process module on site. Connection cable and external housing can be kept.

**Required tools:**
- Hexagon key wrench, size 2

**Caution:**

The exchange may only be carried out in the complete absence of line voltage.

In Ex applications, only a replacement part with appropriate Ex approval may be used.
Caution:
During exchange, protect the inner side of the parts against contamination and moisture.

Proceed as follows when carrying out the exchange:
1. Loosen the fixing screw with the hexagon key wrench
2. Carefully detach the cable assembly from the process module

![Diagram of IPT-2x in IP 68 version, 25 bar and lateral cable outlet, external housing]

3. Loosen the plug connector
4. Mount the new process module on the measuring point
5. Plug the connector back in
6. Mount the cable assembly on the process module and turn it to the desired position
7. Tighten the fixing screw with the hexagon key wrench

The exchange is finished.

8.6 Instrument repair
You can find information for a return shipment under "Service" on our local website.

If a repair is necessary, please proceed as follows:
- Complete one form for each instrument
- If necessary, state a contamination
- Clean the instrument and pack it damage-proof
- Attach the completed form and possibly also a safety data sheet to the instrument
9 Dismount

9.1 Dismounting steps

Warning:
Before dismounting, be aware of dangerous process conditions such as e.g. pressure in the vessel or pipeline, high temperatures, corrosive or toxic products etc.

Take note of chapters "Mounting" and "Connecting to power supply" and carry out the listed steps in reverse order.

9.2 Disposal

The instrument consists of materials which can be recycled by specialised recycling companies. We use recyclable materials and have designed the electronics to be easily separable.

Correct disposal avoids negative effects on humans and the environment and ensures recycling of useful raw materials.

Materials: see chapter "Technical data"

If you have no way to dispose of the old instrument properly, please contact us concerning return and disposal.

WEEE directive 2012/19/EU
This instrument is not subject to the WEEE directive 2012/19/EU and the respective national laws. Pass the instrument directly on to a specialised recycling company and do not use the municipal collecting points. These may be used only for privately used products according to the WEEE directive.
## 10 Supplement

### 10.1 Technical data

#### Materials and weights

²) Not on instruments with SIL qualification.
³) Transmission liquid with measuring ranges up to 40 bar. With measuring ranges from 100 bar dry measuring cell.
⁴) Halocarbon oil: Generally in oxygen applications, not with vacuum measuring ranges, not with absolute measuring ranges < 1 bar abs.
- Sealing, cable gland NBR
- Blind plug, cable gland PA
- Seal between housing and housing lid Silicone SI 850 R, NBR silicone-free
- Inspection window in housing cover Polycarbonate, UL746-C listed (with Ex-d version: glass)
- Ground terminal 316L

External housing
- Housing Plastic PBT (Polyester), 316L
- Socket, wall mounting plate Plastic PBT (Polyester), 316L
- Seal between base and wall mounting plate EPDM (fixed connected)

Seal between housing and housing lid Silicone SI 850 R, NBR silicone-free
Inspection window in housing cover Polycarbonate, UL746-C listed (with Ex-d version: glass)
Ground terminal 316Ti/316L

Connection cable with IP 68 (25 bar) version 5)
- Cable cover PE, PUR
- Type label support on cable PE hard

Connection cable with IP 68 (1 bar) version 6)
- PE, PUR

Weights
Total weight IPT-2x approx. 0.8 ... 8 kg (1.764 ... 17.64 lbs), depending on process fitting and housing

Torques

Max. torque, metric process fittings
- G¼, G½ 50 Nm (36.88 lbf ft)
- G½ front-flush, G1 front-flush 40 Nm (29.50 lbf ft)
- G1½ front-flush (piezoresistive measuring cell) 40 Nm (29.50 lbf ft)
- G1½ front-flush (ceramic/metallic measuring cell) 200 Nm (147.5 lbf ft)

Max. torque, non-metric process fittings
- ½ NPT inside, ¼ NPT, ≤ 40 bar/500 psig 50 Nm (36.88 lbf ft)
- ½ NPT inside, ¼ NPT, > 40 bar/500 psig 200 Nm (147.5 lbf ft)
- 7/16 NPT for tube ¼" 40 Nm (29.50 lbf ft)
- 9/16 NPT for tube 3/8" 50 Nm (36.88 lbf ft)

Max. torque for NPT cable glands and Conduit tubes
- Plastic housing 10 Nm (7.376 lbf ft)
- Aluminium/Stainless steel housing 50 Nm (36.88 lbf ft)

5) Between transmitter and external electronics housing.
6) Fix connected to the sensor.
Input variable - Piezoresistive/Strain gauge measuring cell

The specifications are only an overview and refer to the measuring cell. Limitations due to the material and version of the process fitting as well as the selected pressure type are possible. The specifications on the nameplate apply.

### Adjustment ranges

Specifications refer to the nominal measuring range, pressure values lower than -1 bar cannot be set.

**Min./Max. adjustment:**
- Percentage value: -10 … 110 %
- Pressure value: -20 … 120 %

**Zero/Span adjustment:**
- Zero: -20 … +95 %
### Switch-on phase

Run-up time with operating voltage $U_B$

- $\geq 12$ V DC
  - $\leq 9$ s
- $< 12$ V DC
  - $\leq 22$ s

### Output variable

Output

- Signal: digital output signal, Foundation Fieldbus protocol
- Physical layer: according to IEC 61158-2

Damping (63 % of the input variable)

- $0 \ldots 999$ s, adjustable

Channel Numbers

- Channel 1: Process value
- Channel 8: Electronics temperature

Transmission rate: 31.25 Kbit/s

Current value

- Non-Ex, Ex-ia and Ex-d instruments: 12 mA, ±0.5 mA

### Dynamic behaviour output

Dynamic characteristics depending on medium and temperature

<table>

<td>≤ 200 ms</td>
</tr>
</tbody>
</table>

Damping (63 % of the input variable)  0 ... 999 s, adjustable via menu item "Damping"

**Reference conditions and influencing variables (according to DIN EN 60770-1)**

Reference conditions according to DIN EN 61298-1

- Temperature: +15 ... +25 °C (+59 ... +77 °F)
- Relative humidity: 45 ... 75 %
- Air pressure: 860 ... 1060 mbar/86 ... 106 kPa (12.5 ... 15.4 psig)

Determination of characteristics: Limit point adjustment according to IEC 61298-2

Characteristic curve: Linear

Reference installation position: upright, diaphragm points downward

Influence of the installation position: < 0.2 mbar/20 Pa (0.003 psig)

**Deviations (according to IEC 60770-1)**

Specifications refer to the set span. Turn down (TD) is the ratio: nominal measuring range/set span.

<table>
<thead>
<tr>
<th>Accuracy class</th>
<th>Non-linearity, hysteresis and repeatability with TD 1 : 1 up to 5 : 1</th>
<th>Non-linearity, hysteresis and repeatability with 5 : 1</th>

<td>&lt; 0.2 %</td>
<td>&lt; 0.04 % x TD</td>
</tr>
</tbody>
</table>

**Influence of the product temperature**

**Thermal change zero signal and output span**

Turn down (TD) is the relation nominal measuring range/adjusted span.

The thermal change of the zero signal and output span corresponds to the value F<sub>T</sub> in chapter "Calculation of the total deviation (according to DIN 16086)".

**Piezoresistive/strain gauge measuring cell**

The basic temperature error in % from the above graphic can increase due to the additional factors such as temperature range (factor FMZ) and Turn Down (factor FTD). The additional factors are listed in the following tables.

**Additional factor through accuracy class**
The basic temperature error in % from the above graphic can increase due to the additional factors such as temperature range (factor FMZ) and Turn Down (factor FTD). The additional factors are listed in the following tables.

### Additional factor through accuracy class

<table>
<thead>
<tr>
<th>Accuracy class</th>
<th>0.075 %, 0.1 %</th>
<th>0.2 %</th>
</tr>
</thead>
<tbody>
<tr>
<td>Factor FMZ</td>
<td>1</td>
<td>3</td>
</tr>
</tbody>
</table>

### Additional factor through Turn Down

The additional factor FTD through Turn down is calculated according to the following formula:

\[
F_{TD} = 0.5 \times TD + 0.5
\]

In the table, example values for typical Turn downs are listed.

<table>
<thead>
<tr>
<th>Turn Down</th>
<th>TD 1 : 1</th>
<th>TD 2.5 : 1</th>
<th>TD 5 : 1</th>
<th>TD 10 : 1</th>
<th>TD 20 : 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Factor FTD</td>

</tbody>
</table>
Ceramic/Metal measuring cell - Standard

![Graph showing basic temperature error vs. TD](image)

**Fig. 34: Basic temperature error $F_{\text{Basis}}$ at TD 1 : 1**

The basic temperature error in % from the above graphic can increase due to the additional factors, depending on the measuring cell version (factor FMZ) and the Turn Down (factor FTD). The additional factors are listed in the following tables.

### Additional factor through measuring cell version

<table>
<thead>
<tr>
<th>Measuring cell version</th>
<th>Measuring cell - Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0.075 %, 0.1 %</td>
</tr>
<tr>
<td>Factor FMZ</td>
<td>0.2 %</td>
</tr>
</tbody>
</table>

### Additional factor through Turn Down

The additional factor FTD through Turn down is calculated according to the following formula:

$$F_{TD} = 0.5 \times TD + 0.5$$

In the table, example values for typical Turn downs are listed.

<table>
<thead>
<tr>
<th>Turn Down</th>
<th>TD 1 : 1</th>
<th>TD 2.5 : 1</th>
<th>TD 5 : 1</th>
<th>TD 10 : 1</th>
<th>TD 20 : 1</th>

</thead>
<tbody>
<tr>
<td>Factor FTD</td>
<td>1</td>
<td>1.75</td>
<td>3</td>
<td>5.5</td>
<td>10.5</td>
</tr>
</tbody>
</table>

### Long-term stability (according to DIN 16086)

Applies to the respective digital signal output (e.g. HART, Profibus PA) as well as to analogue current output 4 ... 20 mA under reference conditions. Specifications refer to the set span. Turn down (TD) is the ratio nominal measuring range/set span.7)

### Long-term stability - Ceramic/metallic measuring cell

<table>
<thead>
<tr>
<th>Time period</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>

### Function blocks

**Transducer Block (TB)**

The Transducer Block "Analog Input (AI)" takes the original measured value (Secondary Value 2),
carries out the min./max. adjustment (Secondary Value 1), carries out a linearization (Primary Value) and makes the values on its output available for further function blocks.

**Fig. 40: Schematic presentation Transducer Block (TB)**

**Function block Analog Input (AI)**
The function block "Analog Input (AI)" takes the original measured value selected by a Channel Number and makes it available to additional function blocks on its output.

**Fig. 41: Schematic presentation function block Analog Input (AI)**

**Function block Discret Input (DI)**
The function block "Discret Input (DI)" takes the original measured value selected by a Channel Number and makes it available to additional function blocks on its output.

**Fig. 42: Schematic presentation function block Discret Input (DI)**

**Function block PID Control**
The function block "PID Control" is a key component for various tasks in the process automation and is used universally. PID blocks can be cascaded if this is necessary or requested due to different time constants with the primary and secondary process measurement.
Function block Output Splitter

The function block "Output Splitter" generates two control outputs out of one input. Each output is a linear image of a part of the input. A retrograde calculation function is realised by using the linear imaging function inversely. A cascading of several Output Splitters is supported by an integrated decision table for the combinability of inputs and outputs.

Function block Signal Characterizer

The function block "Signal Characterizer" has two channels the outputs of which are not in linear relation with the respective input. The non-linear relation is defined by a look-up table with individually selectable x/y-pairs. The respective input signal is imaged on the corresponding output, hence this function block can be used in a control loop or signal path. Optionally the function axis can be exchanged in channel 2 so that the block can be also used in a reverse control loop.
Function block Integrator

The function block "Integrator" integrates a continuous input signal over the time and sums the results of an impulse input block. It is used as a totalizer up to a reset or as a subtotalizer up to a reference point at which the integrated and accumulated value is compared with the default values. When these default values are reached, digital output signals will be outputted. The integration function is carried out upwardly starting with zero and downwards with a default value. Two flow values are also available so that the net flow volume can be calculated and integrated. This can be used for calculation of volume and mass changes in the vessel or for optimisation of flow controls.

Function block Input Selector

The function block "Input Selector" offers selection possibilities for up to four inputs and generates an output signal according to the selection criteria. Typical input signals are AI blocks. Selection possibilities are maximum, minimum, mean value, average value and first useful signal. Through parameter combination, the block can be used as rotary switch or as preselection switch for the first useful value. Switch information can be received by other input blocks or the user. Mean value selection is also supported.
Function block Arithmetic

The function block "Arithmetic" allows the simple integration of usual metrological calculation functions. The user can select the requested measurement algorithm according to the name without known the formula.

The following algorithms are available:
- Flow compensation, linear
- Flow compensation, square root
- Flow compensation, approximate
- BTU flow
- Traditional Multiply Divide
- Average
- Traditional Summer
- Fourth order polynomial
- Simple HTG compensated level
- Fourth order Polynomial Based on PV

10.3 Calculation of the total deviation

The total deviation of a pressure transmitter indicates the maximum measurement error to be expected in practice. It is also called maximum practical deviation or operational error.
According to DIN 16086, the total deviation $F_{\text{total}}$ is the sum of the basic accuracy $F_{\text{perf}}$ and the long-term stability $F_{\text{stab}}$:

$$F_{\text{total}} = F_{\text{perf}} + F_{\text{stab}}$$

The basic accuracy $F_{\text{perf}}$ consists of the thermal change of the zero signal and the output span $F_T$ as well as the deviation $F_{KI}$:

$$F_{\text{perf}} = \sqrt{(F_T)^2 + (F_{KI})^2}$$

The thermal change of zero signal and output span $F_T$ is specified in chapter "Technical data". The basic temperature error $F_T$ is shown in a graphic. Depending on the measuring cell version and Turn down, this value must be multiplied with the additional factors FMZ and FTD:

$$F_T \times FMZ \times FTD$$

Also these values are specified in chapter "Technical data".

This applies for a digital signal output through HART, Profibus PA or Foundation Fieldbus.

With a 4 … 20 mA output, the thermal change of the current output $F_a$ must be added:

$$F_{\text{perf}} = \sqrt{(F_T)^2 + (F_{KI})^2 + (F_a)^2}$$

To provide a better overview, the formula symbols are listed together below:

- $F_{\text{total}}$: Total deviation
- $F_{\text{perf}}$: Basic accuracy
- $F_{\text{stab}}$: Long-term stability
- $F_T$: Thermal change of zero signal and output span (temperature error)
- $F_{KI}$: Deviation
- $F_a$: Thermal change of the current output
- FMZ: Additional factor measuring cell version
- FTD: Additional factor Turn down

### 10.4 Calculation of the total deviation - Practical example

#### Data

Pressure measurement in the pipeline 4 bar (400 KPa), product temperature 40 °C

IPT-2x with measuring range 10 bar, deviation < 0.1 %, process fitting G1 (piezoresistive measuring cell)

The required values for the temperature error $F_T$, deviation $F_{KI}$ and long-term stability $F_{\text{stab}}$ are available in the technical data.

1. **Calculation of the Turn down**

   $$TD = 10 \text{ bar}/4 \text{ bar}, \quad TD = 2.5 : 1$$
2. Determination temperature error $F_T$

![Graph showing temperature error determination.]

Fig. 49: Determination of the basic temperature error for the above example: $F_{TBasis} = 0.15\%$

<table>
<thead>
<tr>
<th>Accuracy class</th>
<th>In the compensated temperature range of 10 … +70 °C</th>
</tr>
</thead>
<tbody>
<tr>
<td>Factor FMZ</td>
<td>1</td>
</tr>
</tbody>
</table>

Tab. 29: Determination of the additional factor measuring cell for above example: $F_{MZ} = 1$

<table>
<thead>
<tr>
<th>Turn Down</th>
<th>TD 1 : 1</th>
<th>TD 2.5 : 1</th>
<th>TD 5 : 1</th>
<th>TD 10 : 1</th>
<th>TD 20 : 1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Factor FTD</td>
<td>1</td>
<td>1.75</td>
<td>3</td>
<td>5.5</td>
<td>10.5</td>
</tr>
</tbody>
</table>

Tab. 30: Determination of the additional factor "turn down" for the above example: $F_{TD} = 1.75$

$F_T = F_{TBasis} \times F_{MZ} \times F_{TD}$

$F_T = 0.15\% \times 1 \times 1.75$

$F_T = 0.26\%$

3. Determination of deviation and long-term stability

<table>
<thead>
<tr>
<th>Accuracy class</th>
<th>Non-linearity, hysteresis and non-repeatability</th>
</tr>
</thead>
<tbody>
<tr>
<td>TD ≤ 5 : 1</td>
<td>TD &gt; 5 : 1</td>
</tr>
<tr>
<td>0.05 %</td>
<td>&lt; 0.05 %</td>
</tr>
<tr>
<td>0.1 %</td>
<td>&lt; 0.1 %</td>
</tr>
<tr>
<td>0.2 %</td>
<td>&lt; 0.2 %</td>
</tr>
</tbody>
</table>

Tab. 31: Determination of the deviation from table: $F_{Ki} = 0.1\%$

<table>
<thead>
<tr>
<th>Version</th>
<th>Non-linearity, hysteresis and non-repeatability</th>
</tr>
</thead>
<tbody>
<tr>
<td>Measuring ranges &gt; 1 bar</td>
<td>&lt; 0.1 % x TD/year</td>
</tr>
<tr>
<td>Measuring ranges &gt; 1 bar, isolating liquid, synthetic oil, diaphragm Elgiloy (2.4711)</td>
<td>&lt; 0.15 % x TD/year</td>
</tr>
</tbody>
</table>
4. Calculation of the total deviation - digital signal outputs

- 1. step: Basic accuracy $F_{perf}$

\[ F_{perf} = \sqrt{(F_T)^2 + (F_{kl})^2} \]

$F_T = 0.26 \%$

$F_{kl} = 0.1 \%$

\[ F_{perf} = \sqrt{(0.26 \%)^2 + (0.1 \%)^2} \]

$F_{perf} = 0.28 \%$

- 2. step: Total deviation $F_{total}$

\[ F_{total} = F_{perf} + F_{stab} \]

$F_{perf} = 0.26 \%$ (result of step 1)

$F_{stab} = (0.1 \% \times TD)$

$F_{stab} = (0.1 \% \times 2.5)$

$F_{stab} = 0.25 \%$

\[ F_{total} = 0.28 \% + 0.25 \% = 0.53 \% \]

The total deviation of the measurement is hence 0.53 \%.

Deviation in bar: 0.53 \% of 4 bar = 21.2 mbar

The example shows that the measurement error in practice can be considerably higher than the basic accuracy. Reasons are temperature influence and Turn down.
